Not to Scale

E-3/99 - T-7/13
(Existing joint owned utility pole (PSNH/Fairpoint) in existing Right-of-Way)

E-3/100 - T-7/12

Construction Notes:
NHOS proposes to install a 1/4 inch metal supporting strand between the existing utility poles shown above that will traverse the brook. The strand will be installed at the proposed height (see above). The supporting strand will be secured to each pole using double dead end attachments to prevent any sag in the wire and maintain proper clearances. NHOS will lash a one inch diameter fiber optic cable (PVC jacket) to the strand using a dual lash method to provide security of the fiber over the right of way. The fiber will be tagged with twenty four hour contact information at each pole clamp. NHOS will employ the proper safety personnel during the crossing installation. The proposed install will meet all proper clearances from other Utilities. (see above). Additional pole guys will be added per NEC Rule 264 and as directed by pole owners.

Proposed Oliverian Brook Crossing Haverhill, NH

Notes:
The heights of structures shown hereon are based on field measurements taken with a Nikon 362 total station during a site survey on 09/28/11.
The horizontal distance between the nearest bridge edge and the existing overhead wires is approximately 25'.
The smallest vertical distance from the top of existing bridge deck to the lowest existing overhead wires is 23.1'.
The vertical distance between the top of water and bridge deck is approximately 12'.
The waterway is classified as not suitable for sail boating and per NESC Table 232-1 a vertical clearance of 14' must be maintained between the lowest conductor and 10 year floodplain.

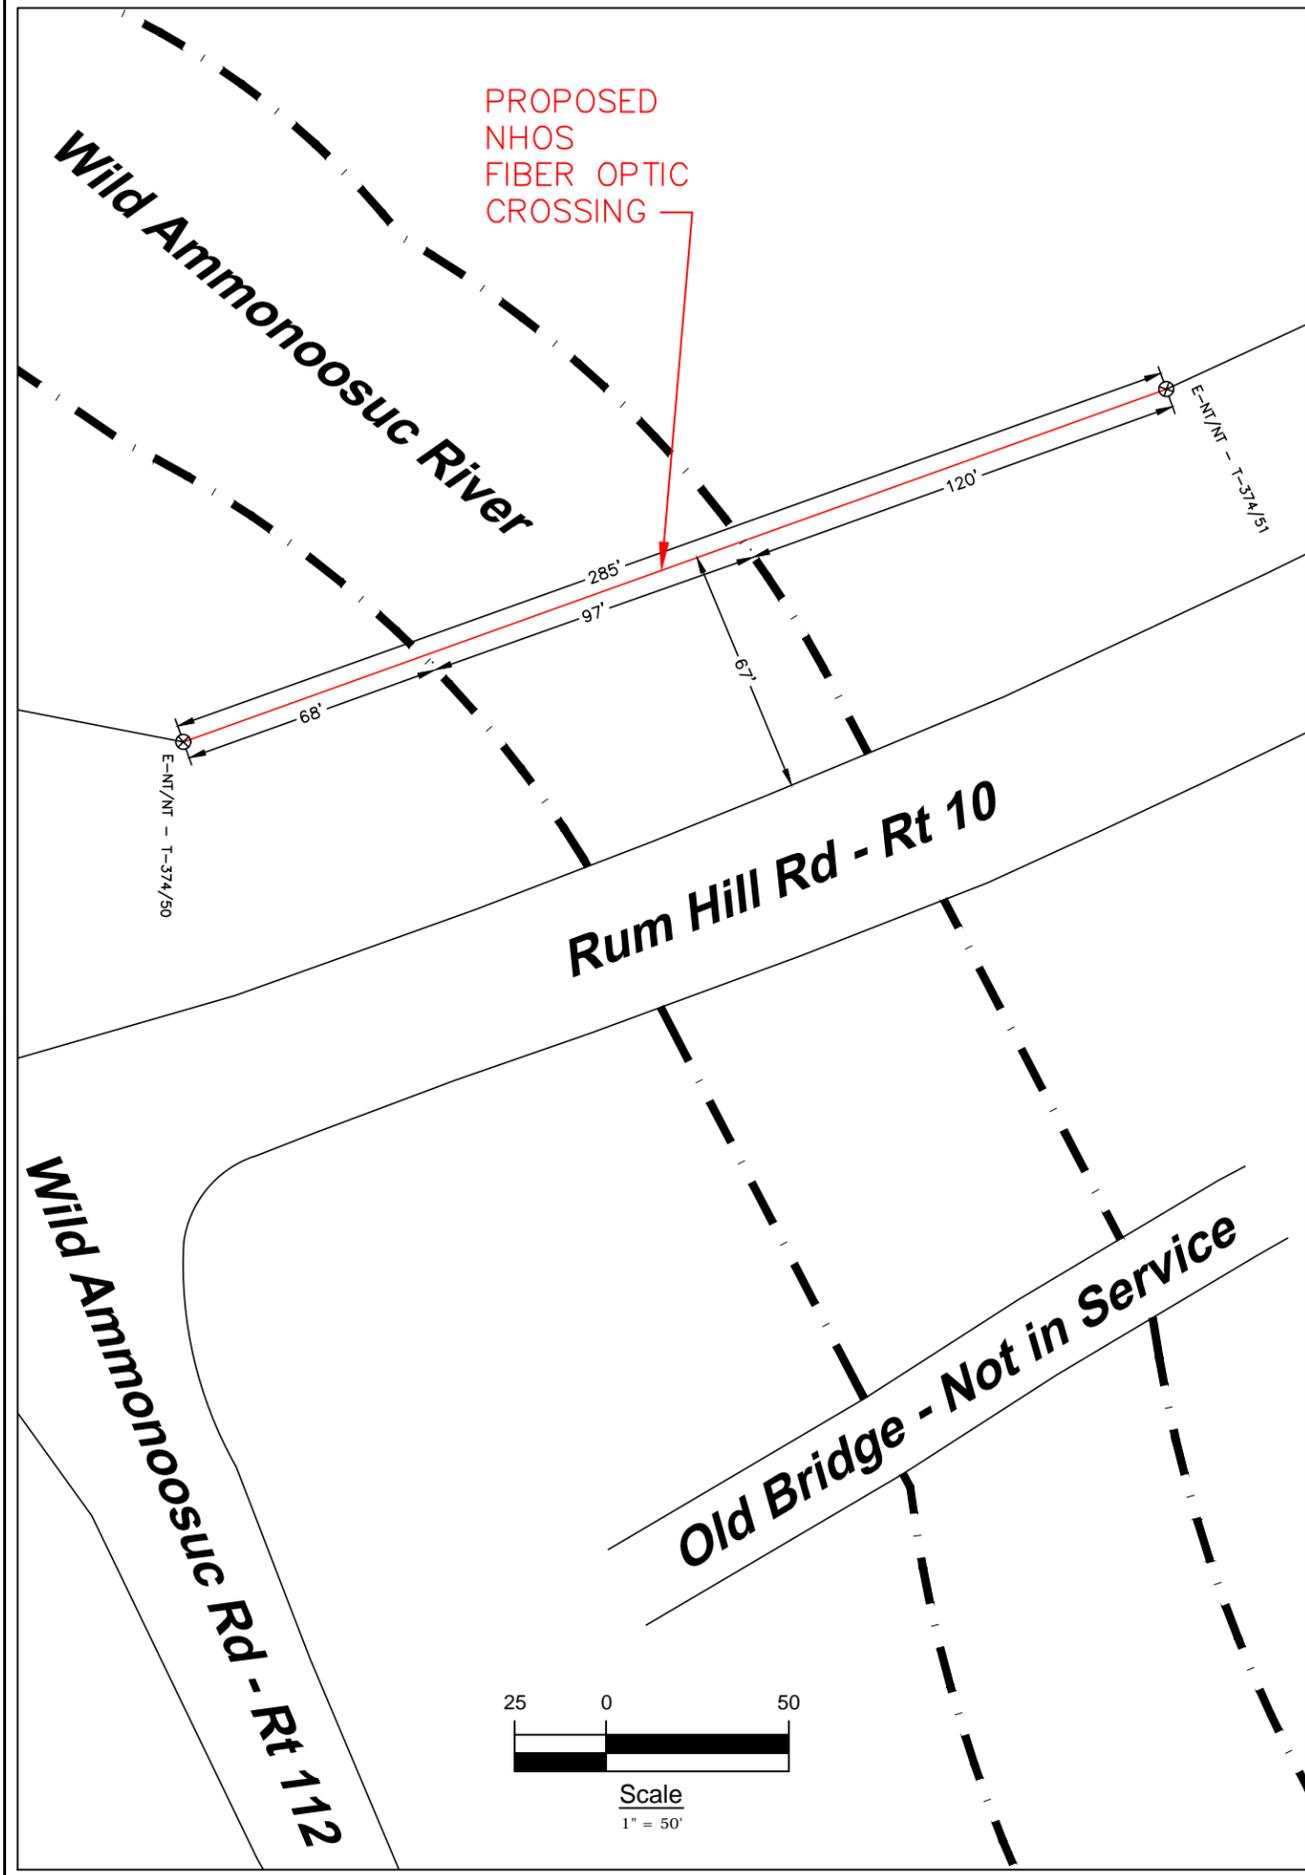

Based on the FEMA Flood Insurance Rate Map for Grafton County (County Map Number 33009C0370E Panel 370 of 1185) dated 02/20/08 there is no FEMA Flood Profile available for the Oliverian Brook and a conservative 10 year flood elevation could not be calculated. Normally this is done by adding the delta between the river bed and the 10 year flood elevation to the surveyed water level and then the 14' buffer (for non-navigable streams) was added to that.
Vertical distances are representative of attachment heights after utility make ready moves are completed.
