S. **Strategic Evaluation Plan**

2016-2018

Massachusetts Statewide Energy Efficiency
STRATEGIC EVALUATION PLAN

October 2015

Table of Contents

1. BACKGROUND

1.1 INTRODUCTION

Evaluation, Measurement and Verification (EM&V) has been an integral component of the efficiency programs in Massachusetts since their inception. Over time, the EM&V process has become more rigorous and strategic, and in 2013-2014 the Program Administrators (PAs), the Energy Efficiency Advisory Council (EEAC) Consultants, and evaluation contractors first introduced a long-term evaluation planning document. The planning document provided the structure that was used to guide evaluation activities during the 2013-2015 Three Year Plan. Due to its success, the same planning framework is repeated here for the 2016-2018 Three Year Plan.

1.2 EM&V FRAMEWORK

Consistent with past three-year plans and the Council's September 8, 2009 EM&V Resolution, the PAs propose to continue the evaluation framework that has successfully allowed the PAs to engage in high quality third-party EM&V efforts. The Council and the PAs find that it is critical that the programs be evaluated, measured, and verified in a way that provides confidence to the public at large that the savings are real and in a way that enables the PAs to report those savings to the Department of Public Utilities (DPU) with full confidence. Additionally, the Council stated that there is a need to ensure both the reality and the perception of the independence and objectivity of EM&V activities, as well as the need to help ensure consistency, timeliness, and credibility of the results. Accordingly, the Council will continue to have an oversight role over the EM&V activities of the Program Administrators to ensure the objectivity and independence of those activities, and the perception of such, and to help ensure consistency, timeliness, and credibility. The Council's oversight role will be accomplished through the Council's EM&V consultant ("EM&V Consultant"), a third-party expert consultant who has primary responsibility for working with the PAs to plan and implement high-quality EM&V activities in Massachusetts.

While PAs and the EM&V Consultant will continue to work diligently to reach a consensus on evaluation issues, where there are areas of difference that may arise that cannot be resolved through consensus during the on-going interactive process between the EM&V Consultant and the PA evaluation staff, authority for decision-making will reside with the EM&V Consultant and the Council.[1]

To enable the Program Administrators to fulfill their responsibility to report program savings to the Department with full confidence, an appeals process has been established, through which the PAs may bring decisions made by the EM&V Consultant or the Council for review and resolution. This process will be implemented through the formation of an evaluation appeals committee ("Appeals Committee") of the Council, whose responsibility in this area will be to hear the matter under dispute and rule so that the study may proceed in a timely way. In general, it is expected that this review process will be completed within 72 hours once an issue is elevated to the Appeals Committee. This Appeals Committee will consist of three voting members of the Council, including DOER. Consistent with general Council proceedings, the Appeals Committee will include and consult with, in both deliberations and decision-making, a representative of both the PAs and the Council's consultant team, neither of whom shall have a vote in the standing committee. The Appeals Committee will review the issues related to the disputed matter, hear from the PA evaluation staff and EM&V Consultant (the "principals"), and make a determination on the outcome of the matter. The decision will be recorded, along with a description of the applicable issues. The participants in the appeal will sign the record of the decision, indicating their acceptance of,

[1] To date the EM&V Consultant and PA Evaluation staff have been able to resolve all areas of differences without proceeding to the Appeals Committee.

the representation of the issues and of the decision. In exceptional cases, where the PAs perceive there to be significant risk to their ability to manage the energy efficiency programs in the near term, the PAs will note their disagreement with the decision of the Appeals Committee on the record of the decision and reserve the right to immediately petition the DPU on the Appeal's Committee's decision. The PAs shall be able to submit any such documents to the DPU in conjunction with the filing of the three-year plans, mid-term modifications, and term reports. The DPU will be able to review the record of this decision in its review of three-year plans, mid-term modifications, plan-year reports, and term reports.

As discussed below, the Evaluation Management Committee has been a key component to keeping communication channels open. To date, all major disagreements have been resolved through a data driven consensus process. It is a testament to the hard work and collaborative engagement of the PAs and the EM&V Consultant that there has not been an occasion where it has been necessary to invoke this appeals process.

The PAs will maintain a statewide focus to the maximum extent possible, will review EM&V budgets with the EM&V Consultant, and will integrate electric and gas evaluation efforts to the maximum extent possible. The Program Administrators will be the main mechanism for contracting with the independent evaluation contractors, and will work with evaluation contractors to maintain privacy of customer data.

1.3 EVALUATION MANAGEMENT COMMITTEE

The PAs and the EM&V Consultant established the Evaluation Management Committee (EMC) to be similar to other management committees. The EMC serves as a steering committee for statewide evaluation issues, providing guidance and direction to each of the evaluation research areas. The EMC works to plan, prioritize and delineate the research studies to be undertaken over the three-year plan period.

The Program Administrators and the EM&V consultant have worked to consistently improve the EM&V process over time. As issues arise, the EMC has established working groups to review and address new topics, areas of concern, or disagreement. For example, in 2014, the PAs and the EM&V Consultant determined that there was no clear path forward to determine an appropriate baseline for a particular program. In response to that issue, the EMC formed a Baseline Working Group, and established guidelines to handle such concerns in the future. An initial summary of the report of this working group is attached at Appendix B. The EMC will continue to establish appropriate working groups to address issues as they arise and keep the EM&V process running smoothly.

1.4 EVALUATION FUNCTIONS

EM&V refers to the systematic collection and analysis of information to document the impacts of energy efficiency programs and recommend improvements in program design and delivery. EM&V includes the following types of studies:

- *Impact Evaluation* refers to the measurement of net or gross savings achieved within overall program populations.
- *Market Effects Evaluation* refers to the measurement of the effects that programs have on the structure and functioning of their target markets.
- *Process Evaluation* refers to the systematic assessment of programs for the purpose of documenting their operations and developing recommendations to improve their effectiveness.
- *Market Characterization or Assessment* refers to the systematic assessment of energy efficiency markets for the purpose of improving the effectiveness of programs targeting those markets.
- *Evaluation of Pilots* refers to EM&V activities intended to assess the effectiveness of pilot programs, determine their potential for full-scale implementation, and develop recommendations for any changes in program approach.

As discussed in Section 1.6, the PAs and EEAC Consultants have utilized evaluation planning principles to assess potential evaluation activities, identify priorities, and determine the appropriate timing of all evaluation efforts since 2010. Research priorities to date have been driven by the need to support Massachusetts' rapid increase in program activity, which has required a commensurate rapid gearing up of the scale of EM&V activity. The rapid increase in EM&V activity required that limited administrative resources be allocated strategically to: (1) impact evaluations intended to ensure that as the savings ramp up the results remain reliable; (2) market assessments intended to help support reaching new markets and penetrating existing ones more effectively; and (3) process evaluations, to help make existing programs more effective.

1.5 SCOPE OF RESEARCH AREAS

1.5.1 RESIDENTIAL

Originally this research area consisted of three separate categories: Residential Retrofit and Low Income, Residential Retail Products, and Residential New Construction. The residential evaluation research area as currently defined includes the following initiatives:

- Residential New Construction
- Home Energy Services
- Multi-Family Retrofit
- Residential Lighting
- Consumer Products
- Residential Heating & Cooling Equipment
- Low Income Single Family Retrofit
- Low Income Multi-Family Retrofit

1.5.2 NON-RESIDENTIAL

The Non-Residential (or Commercial & Industrial, C&I) research area combines two separate categories: C&I New Construction and C&I Retrofit. As of the 2016-2018 Three Year Plan, the C&I initiatives within this research area include:

- New Buildings & Major Renovations
- Initial Purchase & End of Useful Life
- Existing Building Retrofit
- Small Business
- Multifamily Retrofit
- Upstream[2] Lighting

1.5.3 CROSS-CUTTING

This research area covers topics that do not fit cleanly into either the Residential or Non- Residential research areas, as well as additional specialized topics in which it is particularly important to ensure consistency across research areas and markets. Topics within this research area include, but are not limited to:

- Behavioral Programs
- Codes & Standards

[2] Upstream refers to the buy down of products at the distributor-level rather than the end-user-level (incentives are provided further up the supply chain). Typically, monetary savings that the distributors experience are passed on to contractors and eventually the end-user but the end-user is often unaware that they participated in an energy efficiency program.

- Community Mobilization Initiatives
- Education & Training
- Market Effects
- Net-to-Gross (NTG)
- Non-Energy Impacts (NEI)
- Program & Portfolio Marketing
- Top-Down Modeling[3]

1.6 PLANNING PRINCIPLES

Collaboratively, the PAs and EEAC Consultants have developed the following set of four primary evaluation planning principles and four additional considerations, which collectively are utilized to assess potential evaluation activities, identify priorities, and determine the appropriate timing of all evaluation efforts.

There are four primary principles that establish the priority of the evaluation research:

1. Importance. Allocate evaluation resources to research questions that have a significant impact on demand-side management (DSM) investments or that directly inform significant policy questions and stakeholder interests. Not all programs and measures contribute equally to the PA's DSM portfolio. Therefore, the PAs and EEAC Consultants will focus available evaluation resources on the programs and measures that generate the greatest savings and require more recent and accurate evaluation findings.

2. History. Make the most of existing research before investing in additional research. This includes previous evaluation research conducted in Massachusetts and other relevant research, such as that conducted by the Northeast Energy Efficiency Partnerships or other relevant secondary sources of information. As the PAs have been conducting evaluations for over 20 years, the PAs will leverage, build-on, and complement the wealth of historical information available when prioritizing and planning evaluations. However, the PAs and EEAC consultants recognize that some of this information becomes dated and that updated information might be valuable, even for smaller contributors to portfolio level savings. The PAs and EEAC consultants attempt to assess the likely shelf-life of different types of data, based on an assessment of how rapidly the programs, technologies, economy and markets are likely to be changing.

3. Uncertainty. Allocate evaluation resources to research questions with the greatest uncertainty. Uncertainty may be due to dependence on dated research, introduction of new measures or evaluation methodologies, and/or variability in programs operating in quickly evolving markets. To ensure savings estimates and program designs reflect current market conditions, the PAs and EEAC Consultants will assess programs and measures in more dynamic markets with greater frequency. Similarly, evaluation practices also evolve over time and new best practices are established. Consequently, the PAs and EEAC Consultants prioritize evaluations that will apply improved methodologies or that will take advantage of data not previously available.

4. Timing. Ensure the timing of the research is appropriate for the research questions being asked. Is the program mature enough to allow the research to produce viable results? Is there a significant program change underway

[3] Top-down modeling can be used to estimate program net impacts and can capture effects of multiple programs jointly contributing to aggregate savings. Top-down modeling is an economic approach to measure program impacts using cross-sectional and time series data. These models measure changes to aggregate energy consumption relative to changes in energy efficiency programmatic activity, prices and other economic factors with a goal of isolating the effect of program activity from other natural changes and policy variables. A top-down modeling methods study was produced as part of the work completed in the cross-cutting research area.

that may affect the results or affect the usefulness of the results? Typically, it is not necessary to evaluate a mature program annually, though it may make sense with a new program. The PAs and EEAC Consultants will evaluate the major elements (impact, process, NTG, other) of each significant PA program as part of a multi-year evaluation cycle.

Once the priority is established, there are four additional principles considered when establishing the evaluation research portfolio. These include:

- Balance -- The PAs and EEAC Consultants undertake a mix of studies each year, in terms of the evaluation elements assessed (impact, process, NTG, other) and which programs are evaluated.
- Depth -- Greater resources always allow for more in-depth study, and typically more reliable evaluation findings. The PAs and EEAC Consultants consider each evaluation option as an investment and determine the level of study needed to cost-effectively estimate savings.
- Flexibility -- Unanticipated but not yet known or identified evaluation may arise over time. To ensure that these issues may be addressed, the PAs will allocate sufficient resources for unidentified ad hoc evaluation efforts. The PAs and EEAC Consultants develop evaluation plans with flexibility to add evaluation activities (such as pilot evaluations or assessments of the effectiveness of mid-year program design changes) without compromising the timing and quality of concurrent evaluation work.
- Differences – The PAs and EEAC Consultants recognize that there can be legitimate reasons for variations in findings of statewide studies within small vs. large PAs, gas vs. electric PAs, or within definable economic/demographic areas of the state. When appropriate, evaluation research activities may be implemented in a manner that ensures consideration, identification, and documentation of any such legitimate differences.

While planning strategies vary depending on the particulars of each specific study, the following outlines the principles that apply to each type of evaluation.

- Impact Evaluation – The core principles driving impact evaluation planning are Importance and Timing. When determining which end-use(s) to study, the evaluation team considers both the vintage of the most recent study as well as the percent of savings an end-use represents within a program and portfolio. Uncertainty is also an important principle as the availability of higher quality data or improved evaluation methodologies offer opportunities to more reliably estimate energy savings. Secondary principles considered in this planning process are Balance and Depth.
- Market Effects Evaluation – The two core principles for determining if a market effects study is warranted are Timing and Importance. A successful Market Effects study requires both a baseline market measurement prior to program intervention and a follow-up market measurement to assess the program's impact on the market, ideally 2 or 3 years after the program is introduced. Secondary principles that are also considered are Balance and Differences.
- Process Evaluation – The core principles driving process evaluation planning are Uncertainty and Timing. When determining the appropriateness of conducting a process evaluation of a specific program or initiative, the evaluation team looks at the maturity of the program as well as whether any changes to program delivery or market conditions have recently occurred. In the event changes have occurred or if a program or initiative is new, a process evaluation is typically warranted. However, prioritizing early feedback on program or market changes must be balanced with appropriate consideration, such as a program or initiative that is still undergoing significant changes and therefore should not be evaluated as the findings may be premature and therefore not likely to be useful. Secondary principles considered in the planning process are Importance, Balance and Depth.
- Market Characterization or Assessment – Similar to process evaluation, Uncertainty and Timing are the core principles considered in planning market assessments. In addition, History plays a key role as the evaluation team must consider the information already available about a given market prior to commencing new research. When considering the relevance of historical data, the evaluation team will

also assess the volatility or changes occurring in the market in question. Secondary principles that are also considered are Differences and Balance.

- Evaluation of Pilots – The core principles driving the planning of evaluation of pilots are Timing and History. In general, the evaluation team considers if other sources are available that provide credible estimates of savings. In addition, the evaluation team considers the timing of the pilot effort and conduct evaluations of any kind only when the timing is appropriate.

1.6.1 RESIDENTIAL

For Residential, the specific strategy for planning impact evaluations is dependent on three things: the size of each core initiative or end-use, when each core initiative or end-use was last evaluated, and whether or not the program has undergone recent and significant changes. Particularly large programs, or major end-uses within programs, are evaluated on a more frequent basis to ensure the largest contributors to savings in the statewide portfolio are accurate. In addition, the PAs and EEAC Consultants consider evaluating smaller programs, even if the program represents only a small portion of our portfolio savings. Finally, if a program undergoes significant changes, or is newly developed, the PAs and EEAC Consultants consider an evaluation to understand how well the program is performing and identify any issues with the delivery as early as possible.

1.6.2 NON-RESIDENTIAL

In regards to Non-Residential impact evaluation studies, these have traditionally followed a rotating strategy as described in the 2013-2015 Strategic Evaluation Plan[4]. However, there is a hypothesis among PA evaluation staff and the EEAC consultants that impact evaluation results have shown stability, so the evaluation consultants have been asked to investigate whether results are in fact showing consistency. If the stability of Non-Residential impact evaluations is confirmed, the PA evaluation staff and EEAC consultants may revise the current rotation evaluation strategy so that key methodological issues, such as baseline investigation, can receive increased attention. Impact evaluations, however, will always remain an important and necessary component of Non-Residential EM&V efforts, especially as new initiatives are introduced and mature programs need to be periodically evaluated for over/under performance.

1.6.3 CROSS-CUTTING

For each cross-cutting topic area, specific planning strategies may vary. A brief overview of the current strategy for each topic area follows.

- Behavioral Programs – Multiple impact evaluations have been performed for each distinct behavioral effort in the state. As programs mature and stabilize, this research area will update realization rates periodically, in line with the governing principles discussed above. As new behavioral programs and strategies are implemented, it is anticipated that there would be repeated early evaluation until results stabilize and a reliable realization rate can be developed.

- Codes & Standards – A detailed evaluation plan for the Code Compliance Support Initiative (CCSI) was developed in August 2014 and amended in April 2015. Evaluation plans for other components of the Codes and Standards Initiative will be proposed shortly after the implementation plans are developed. The evaluation work for the CCSI and the work to be proposed for other components provide overall coordination with implementation to ensure that the necessary data are collected to (1) provide early feedback on the implementation of the Initiative; (2) evaluate the impact of Codes and Standards efforts; and (3) determine the appropriate attribution of energy savings to the PAs. Overall work

---

The 2013-2015 Strategic Evaluation Plan can be found on the Massachusetts EEAC website:

performed will include surveys of participants, assessment of baselines at the beginning and end of code cycles, and careful documentation of the PAs' specific efforts. In addition to laying the groundwork for evaluating Codes and Standards impacts, the evaluations will support the future development of the Codes and Standards Initiative -- for example, by clarifying where the greatest opportunities lie.

- Community Mobilization Initiatives; Education & Training – For these two topic areas, process and impact evaluations are performed as appropriate based on the defined goals of each delivery model and the planning principles discussed above. Each new in-the-field effort is reviewed to determine whether a specific evaluation of the effort should occur. Evaluation efforts will focus on new or changing delivery models rather than established models, but all efforts will be periodically reviewed.

- Market Effects – Planning will focus on (1) quantifying market effects where the necessary data are available for programs previously identified as being likely to induce measurable market effects; (2) attempting to acquire market penetration data to use in quantification; (3) providing program planning, implementation, and evaluation staff with the market information they need to maximize market effects from program activities; 4) coordinating work among the evaluation teams to track appropriate market progress indicators to support market effects evaluation in the future without duplicating efforts or overburdening limited market actor groups; and 5) developing recommended market effects approaches for any additional programs identified as being likely to induce measurable market effects. This is expected to include undertaking studies to track market effects indicators and quantify market effects, developing market actor panels to supply critical market-level data, and carrying out market characterization studies, such as those for multifamily retrofit and commercial refrigeration.

- Top-Down – Top-Down Methods employ aggregate consumption and macro-economic data to measure reductions in energy use resulting from energy efficiency efforts. Over the past year and a half, activity in this topic area has resulted in an abbreviated top-down modeling literature review, as well as an Expanded Methods review to better understand the strengths and weaknesses of the approaches that have been used, and the necessary data requirements. The team also completed the two pilot studies—the PA-Municipal Utility pilot study (residential and C&I) and the PA-Data pilot study (C&I only). In the 2016-2018 Three Year Plan, work in this topic area will result in (1) recommendations for using the results of top-down methods in conjunction with market effects and NTG results to claim savings, (2) identification of additional top-down modeling that should be conducted and when, and (3) deeper examination of the key econometric concerns that should be addressed with models going forward in order to make the results more reliable.

- Net-to-Gross (NTG) – After initial work in the 2010-2012 Three Year Plan to identify, standardize, and document research methods in this area, evaluation efforts in the past three years focused on quantifying NTG ratios for the PA's downstream C&I programs—two studies were completed for electric measures and two for gas measures. In the 2016-2018 Plan, this topic area will research how NTG results should be integrated with market effects and top-down modeling results in planning, program design, and claiming savings; re-examine the most appropriate approaches for estimating NTG under different circumstances and with different types of customers/program models; research what is driving the differences in NTG ratios by end-use and over time; and repeat NTG studies as needed.

- Non-Energy Impacts (NEI) – Similar to NTG, initial work in this area focused on developing methods for quantifying NEIs attributable to the PA programs. Research in this area continues to quantify appropriate NEIs for the C&I new construction programs. This topic area also examines additional NEIs that may be appropriate to either study for the first time, or further update or refine.

- Program & Portfolio Marketing – Currently, this area focuses on determining the effectiveness of each statewide marketing campaign. Each year, a pre- and post-survey is done to measure the impact of the campaign in raising brand and program awareness. Additional work will measure brand effectiveness as well as support marketing efforts with specific smaller scale evaluations as necessary.

- Additional Work – Work in this area may cross multiple topics in order to identify overarching market trends and consumer behavior. Some additional cross-cutting work is typically developed on a short turnaround, ad-hoc basis. This work may include literature reviews or surveys of programs in other jurisdictions and other smaller scale work designed to inform implementation efforts or program strategy.

In addition to the topics and strategies discussed above, another priority of this research area is to retain the flexibility to respond to new efforts in the field to provide appropriate and timely evaluation support.

1.7 AVAILABLE BUDGET

The EM&V budget available to the research areas for the 2016-2018 Plan is projected to be in line with historical program budget levels. Twenty percent of each sector's available evaluation budget is allocated to the Cross-Cutting research area. The remaining evaluation budget in the residential and low-income sector is allocated to the Residential research area; the remaining evaluation budget in the C&I sector is allocated to the Non-Residential research area.

Total evaluation budgets for the 2016-2018 Three Year Plan term are expected to be $18.7 million for gas programs and $41.3 million for electric programs.

1.8 ASSIGNED STAFF

There are approximately 14 PA full time equivalent (FTE) employees assigned to MA evaluations as a portion of their job responsibilities, with over 20 PA employees actively engaged in study oversight. The PAs currently contract with several external evaluation experts to supplement staff. External evaluation experts are employed in addition to the evaluation contractors that are responsible for completing the evaluations in each research area.

1.9 STAGES OF EVALUATION

The stages through which a project moves from an initial idea to being completed are as follows:

Stages of Evaluation

Stage	**Document Under Review**	**Description**
Stage 1: Conceptual Framework	1 Page Summary	Provides conceptual framework for the project including a very high-level budget and timing, as well as the objective or goal.
Stage 2: Preliminary (High Level) Work Plan	2 - 3 Page Summary	Provides strategies to meet objective including more detail on the potential research design, level of effort (number of surveys, site visits) including additional detail on budget/timing.

Stage	Document Under Review	Description
Stage 3: Detailed Work Plan	3 – 25 Page Work Plan	Provides detailed sampling and analysis plans; specific staffing and milestone deliverables.
Stage 4: In Progress	Status Report	Work is conducted consistently with plan – there may be detailed planning occurring simultaneously with execution on early tasks.
Stage 5: Reporting	Draft Report	Period from draft report through final report and any review/communications/meetings in-between, includes paperwork for submittal.
Stage 6: Complete	Final Report	Report is finalized and either filed or ready to be filed with the DPU.

There are multiple planning stages since there is a need for projects to proceed incrementally from concept to preliminary work plan to detailed work plan. By proceeding incrementally, the PAs and EEAC Consultants are not only able to better manage the stakeholder review process but effectively stage studies across the three research areas.

The methods in which stakeholders are engaged can vary based on the stage of evaluation. The PAs have hosted strategic evaluation planning meetings to encourage participation in the early stage of the evaluation planning process and solicit input from a wide variety of program stakeholders. Additionally, there is active engagement with both program implementers and policymakers to identify additional key research needs and to further refine project recommendations developed at the strategic evaluation planning meetings.

Much of the stakeholder engagement happens through the Residential Management Committee and C&I Management Committee. Since both PAs and EEAC Consultants are members of the management committees, stakeholder engagement at the committee meetings by the research area leads has been successful. For projects in stage 1, one page summaries are developed and shared with the management committees. Progress on projects in stages 2, 3 and 4 (preliminary and detailed work plans and in progress) is also provided to the management committees and for projects in stage 5, draft reports are shared with the management committees.

Input from non-utility stakeholders represented on the Council generally flows through the EEAC consultants. A representative from the EMC attends RMC and CIMC meetings as frequently as possible in order to facilitate coordination and solicit feedback from the various management councils and working groups.

1.10 RESEARCH COMPLETED DURING 2013-2015 PLAN TERM

1.10.1 RESIDENTIAL

Since 2010, the PAs and EEAC consultants have supported over 65 residential evaluation studies grouped into three subject areas: lighting and products, heating and cooling, and whole house. Highlights of recent residential evaluation studies are summarized below.

1. **Lighting and Products.** A primary point of focus was continuing to track the residential lighting market and its reaction to PA activity and the Energy Independence Security Act of 2007. Research has included:
    - On-site lighting inventories of homes in Massachusetts, New York, Georgia, and Kansas;
    - Interviews with lighting manufacturers and lighting retailers;
    - Assessment of store shelf stocking practices;
    - Customer surveys; and
    - Metering household lighting to assess hours of use.

For the first time, point-of-sale data was obtained from most channels for lighting sales. This provided a source for definitive data on market share of efficient lighting. Use of tools such as web-scraping also provided insights into the pricing of efficient lighting. Trends in prices provided a basis for projecting what prices might be for the next three years, which in turn can be used to inform program planning efforts and support projections of prospective NTG values. Households participating in on-site inventories and panel studies yielded insights into bulb replacement behavior.

Key Evaluation Findings To Date: (a) Massachusetts households exhibited higher CFL and LED socket saturation (percent of sockets filled with a bulb type) and penetration (percentage of households using at least one bulb of a type) than all three comparison areas. (b) The delta watts for program-supported bulbs have decreased, which affects program planning for 2016 to 2018. (c) The recommended NTG retrospective ratios for CFLs ranged from 53% to 95% while those for LEDs hovered at around 100%. (d) Prices for LED incremental costs are expected to decrease as CFL and halogen prices stabilize but LED prices continue to fall. (e) The overall hours of use stood at 2.7 regionally, but were higher for efficient bulbs (3.0 hours) versus inefficient ones (2.3 hours).

2. **Heating and Cooling**. Several studies focused on HVAC and water heating measures were conducted during the 2013-2015 period, including:
    - ***Impact evaluation of high-efficiency furnaces and boilers*** - On-site metering and billing analyses were conducted to update heating equipment savings values for gas furnaces and gas boilers.
    - ***Impact evaluation and baseline assessment of DMSHPs*** - A comprehensive on-site metering effort was conducted to explore appropriate baseline technologies, energy savings, interaction with existing heating systems, and more information around cold-climate DMSHPs.
    - ***Assessment of energy-efficiency related incremental cost associated with central cooling and heat pump equipmen***t - This study evaluated and estimated how equipment costs and prices change as equipment efficiency increases, supporting the design of cost-effective rebates.
    - ***Assessment of Net-to-Gross values applicable to heating measures*** - This study included research with manufacturers, distributors and contractors and is serving as a platform to build from for the HVAC market effects research.

Key Evaluation Findings To Date: (a) both standard and high-efficiency boilers are less efficient than their ratings, often not being controlled to maximize potential savings, while standard efficiency furnaces perform slightly higher than ratings and high-efficiency furnaces perform at their ratings; (b) participants with combined boilers (combined heating and small hot water tanks) consume less gas than other homes; (c) Net-to-gross is 77% for boilers and 81% for furnaces (AFUE≥95%), (d) customers that purchased DMSHPs with the intent of heating used their units primarily for heating, while users whose stated purchase intent was cooling often used their units for heating as well; (e) while approximately 31% of participants stated cooling-only intentions regarding their DMSHP purchases, approximately 40% of them used it for both heating and cooling.

2. **Whole-House**. Several whole house studies were completed focusing on retrofits and both single and multifamily buildings, including the following:
   - ***Home Energy Services Program Delivery Assessment*** – A data-driven assessment of HES core initiative effectiveness which detailed a number of key performance indicators, compared performance between service providers (i.e., Lead Vendors and Home Performance Contractors), and explored cross-program participation.
   - ***HEAT Loan Assessment –*** Explored extent to which no-interest loans for energy-efficiency influence customer decision making in the HES program.
   - ***Low-Income Multifamily Impact Evaluation –*** This study assessed electric and gas savings associated with low-income multifamily retrofits. Methods used included gas billing analysis, common area light metering, and engineering algorithm review.
   - ***Multifamily Process and Impact Evaluations*** – This study aimed to monitor the Multifamily initiative's current state as a standalone or integrated offering; and provide an ongoing examination of barriers, program operations, and customer experience. A billing analysis was performed to attempt to assess energy saving.
   - ***Residential Customer Profile Study (RCPS)*** – Through integration of a wide array of data sources (e.g., billing data, program participation/tracking data, U.S. Census data, Residential Energy Consumption Survey (RECS)), this research assessed levels and patterns of participation for programs across different PAs. The study also conducted a regional assessment of upstream lighting program impacts that are distributed geographically based on income-driven purchase behavior patterns and GIS analysis of driving time and distance to retailers.
   - ***New Construction Baseline studies of Single Family and Multifamily High-Rise Buildings*** – These market assessments are aimed at exploring baseline research in new construction, with a focus around building practices, code compliance, and building characterizes for these markets.

   Key Evaluation Findings To Date: (a) Each unique HES delivery channel offers complimentary approaches (each with their own benefits and limitations) for delivering the program and help expand the reach of the HES initiative, (b) the HEAT Loan has been successful in promoting deeper/broader savings, acting as a motivating factor for a select group of customers (who choose to use the loan) and a business tool for contractors, though opportunities remain for increasing awareness among HES participants; (c) the RCPS found, in 2013, over 15,000 customer premises (not including behavioral) across the state participated in two or more core initiatives (representing 7.7% of total program participation across fuels); (d) through a billing analysis, the Low-Income Multifamily initiative achieved approximately 21% savings relative to pre-retrofit natural gas consumption.

1.10.2 NON-RESIDENTIAL

Since 2010, the PAs and EEAC consultants have supported 55 non-residential evaluation studies in four major research areas: impact evaluations, process evaluations, net-to-gross evaluations, and market assessments (see figure below). These studies seek to quantify program impacts and provide focused, actionable recommendations to improve the performance and efficiency of non-residential programs.[5]

During the 2010 to 2015 contract period, the non-residential evaluation team also developed a C&I Evaluation Database—complete with four years of PA billing and tracking data, GIS libraries, and tax assessor data—to provide a consistent, efficient underpinning for all current and future non-residential evaluation activities.[6] This database allows the team to identify and analyze differences in PA customer usage and program participation over time. For example, we can examine whether participation in a certain sector, region, service territory, or program (or any combination thereof) has increased or decreased from 2011 to 2014, providing insight into trends and areas of opportunity for program activity.

Highlights of recent non-residential evaluation studies are summarized below.

Impact Evaluations
Impact evaluations provide an independent assessment of the energy and/or demand savings achieved by a specific population of energy efficiency measures, and provide recommendations focused on improving the program and the accuracy of its savings estimates.

Thirteen non-residential impact evaluations were recently completed (see list below). This work included an investigation to determine the impact of upstream C&I lighting programs, several high-rigor evaluations of electric custom and prescriptive programs, and several gas measure evaluations.

Impact Evaluations:

1. Custom Electric Impact – Refrigeration, Motor, Other
2. Upstream Lighting Impact
3. Custom Electric Impact – CHP
4. Prescriptive Gas Impact – Boiler, Furnace, Infrared Heating, Indirect Water Heater
5. Custom Gas Impact – Desk Review
6. Custom Gas Impact – NSTAR Onsites
7. Custom Electric Impact – HVAC
8. Prescriptive Electric Impact – Chillers, Compressed Air
9. Prescriptive Gas Impact – Spray Valves
10. Custom Gas Impact – Desk Review & Site Visits
11. Prescriptive Gas Impact – Thermostat, Steam Trap
12. Custom Electric Impact – Process
13. Upstream Lighting Program – In Storage Lamps Follow-Up Study

---

[5] To further ensure actionable results, the non-residential evaluation contractor team now submits a one-page summary with each draft report to communicate the study's purpose, results, and recommendations to key stakeholders who may not have time to read detailed research reports.

[6] The fourth year of data was added to the Evaluation Database in 2015 as part of the ongoing Customer Profile study.

Process Evaluations
Process evaluations analyze information on a program's operations and—on the basis of that analysis—identify practical approaches to improve that program in relation to program goals.

Six non-residential process evaluations were undertaken in the last contract period (see list below). This work included an expansion of a comprehensive process evaluation conducted in 2011, and studies that focused on upstream lighting programs, small business engagement, differences among PAs that affect performance, and the participation of mid-size C&I customers.

Process Evaluations:

1. Upstream Lighting Process Evaluation
2. Mid-Sized Customer Needs Assessment
3. Whole System Approach Assessment
4. How PA Differences Affect C&I Outcomes
5. Learning from Successful Projects
6. Direct Install Process Evaluation

Net-to-Gross Evaluations
Net-to-gross (NTG) evaluations estimate energy savings that are specifically attributable to the program under study. This research area also includes market effects research and baseline studies.

Three non-residential NTG evaluations were undertaken in the last contract period (see list below).[7] Market effects[8] remained a priority for the PAs and EEAC. Given the rapidly evolving Light Emitting Diode (LED) market, the team investigated the baseline for LEDs in Massachusetts to lay the groundwork for future assessments of market effects within the C&I lighting market. The PAs and EEAC also investigated LED spillover[9] to understand the extent it's contributing to program net savings, and the team began an effort to better understand HVAC supply-side market actors and differences by HVAC equipment types. Our team's work on the LED studies, in particular, is at the forefront of market effects research nationally. We will be building on this body of work with a retrospective market effects study on C&I lighting and a prospective baseline study on lighting controls in the new contract period.

NTG Evaluations:

1. Commercial New Construction Energy Code Compliance Follow-Up Study
2. LED Market Effects: Baseline Characterization
3. Characterization of (HVAC) Supply-Side Market Actors

Market Assessments
Market assessments characterize and assess changes in market conditions for energy efficiency products, and provide information to help PAs influence those markets to increase energy savings.

Eleven non-residential market assessments were undertaken in the last contract period (see list below). This work included the 2011, 2012, and 2013 C&I Customer Profile studies—which analyzed PA customer usage and tracking

---

[7] Five NTG projects were initiated in the last contract period ; however, one was a coordination project, and one was cancelled before completion. Thus we only list three studies in this section.
[8] See Section 1.4 for "market effects" definition.
[9] "Spillover" refers to program influence beyond the program's design. For example, PA programs to support efficient lighting, not necessarily LED lighting, may be influencing the LED market. The LED spillover study mentioned here was initiated in April 2015. A final report will be filed with the 2016-2018 Three Year Plan.

data in order to identify where C&I energy efficiency savings and participation are occurring, and what segments remain to be served—and a multi-year research effort to better understand existing building stock and technology saturations (i.e., the prevalence of each technology in the existing building stock) of C&I customers in Massachusetts. This market characterization effort divided the general population into building and customer segments, examined the level of energy efficiency activity and awareness of energy efficiency opportunities among existing customers, and collected data to support other evaluation studies. The project has included a general population survey and a large-scale on-site data collection effort (anticipated 800 completes).

Market Assessments (2012/2013 – 2014/2015):

1. Existing Buildings Market Characterization – Phone Survey
2. Existing Buildings Market Characterization – Site Visits
3. Lighting Controls Assessment
4. 2011 C&I Customer Profile
5. 2012 C&I Customer Profile
6. 2013 C&I Customer Profile
7. Commercial Real Estate Survey Analysis
8. Boiler Market Characterization
9. Boiler Market Characterization Phase II
10. T-12 Phase Out Market Assessment
11. Market Share Assessment

1.10.3 CROSS-CUTTING

Top-Down, Net to Gross, Market Effects, Code Compliance, and Non-Energy Impacts (NEIs)

There are a variety of methods that can be used to estimate net savings attributable to the PAs' programs and they all have pluses and minuses. The first four topics below examined different methods that can be used to provide estimates of net savings.

1. **Top-Down Modeling** is an econometric approach to measuring program impacts across all programs in a geographic region. It models energy consumption as a function of variables such as programmatic activity, price, weather, and other economic factors. The objectives of this research were to:
    - Review existing top-down modeling studies and techniques
    - Recommend specific approaches to be piloted in MA during the first year of the study
    - Obtain the necessary data for employing one or more agreed approaches
    - Implement the agreed upon pilot approaches
    - Establish next steps for model specifications and data requirements for the top-down modeling efforts to be employed in the second year and beyond

    To accomplish these objectives, the team prepared an abbreviated top-down modeling literature review and an Expanded Methods review to better understand the strengths and weaknesses of the approaches that have been used as well as the necessary data requirements. The team also completed the PA-Municipal Utility pilot study (residential and C&I) and the PA-Data pilot study (C&I only). The PA Municipal Utility pilot used publicly available aggregate data to contrast changes in consumption in the C&I and residential sectors relative to programmatic activity by the PAs and Municipal Utilities. The PA-Data model used PA tracking and consumption data.

    Key Evaluation Findings to Date: (a)The literature and methods review conclude that top-down modeling may provide an additional tool in the set of tools used to evaluate the portfolio of programs; (b) The pilot studies confirmed that there are many challenges to collecting the necessary data over a sufficiently long time period; (c) the PA-Muni model showed significant results, although the error bands are wide; (d) the

PA-Data model, though not significant, demonstrated that with sufficient data top-down models may be able to address many policy questions; and (e) The pilot modeling effort provides preliminary evidence that the combined impact of programs may be responsible for substantial spillover effects.

2. **Self-Report C&I Net-to-gross (NTG) studies**. Since 2011, the team has conducted 4 NTG surveys with participants in the MA C&I downstream programs (2 electric and 2 gas). Prior to implementing these studies, the team conducted an extensive literature review in 2011 of the various methodologies used to assess free-ridership and spillover for C&I and residential downstream programs across the country and made recommendations for consistent approaches to apply in MA. The C&I electric NTG studies were conducted in 2011 and 2014, and the C&I gas NTG studies were conducted in 2012 and 2014-2015 (on-going).

   Key Evaluation Findings to Date: (a) Overall, statewide NTG ratios were relatively stable between studies conducted in 2011 and 2014; (b) Electric NTG ratios are higher for electric measures than they are for gas measures; (c) NTG ratios can vary dramatically between end-uses; (d) Electric NTG results are similar between municipal buildings in Green Communities and non-Green Communities; and (e) for some electric end-uses and many gas end-uses, the small number of participating customers makes the estimates more volatile and it is difficult to utilize end-use specific results.

3. **Market Effects**. Market Effects studies seek to find evidence of and measure spillover savings from program-induced changes in the structure of the market. The objectives of this research were to:
   - Understand and agree to working definitions of what market effects are and what conditions could lead to them
   - Identify and prioritize specific markets that may be sufficiently influenced by existing or planned programs
   - Develop methodologically consistent approaches for assessing market effects within these markets
   - Identify how the PAs can improve the evaluability of market effects for the programs or parts of programs targeting these markets.

   To accomplish these objectives, the team held workshops with PA evaluation and program staff and the EEAC to agree on the definition of market effects and identify and prioritize specific markets for expedited and future market effects studies. These markets included four HVAC markets, the Commercial Lighting market, and the non-residential New Construction market. For each of these markets, the team prepared a methods document which provided an overview of the market and contained recommendations for conducting market effects research.

   Key Evaluation Findings to Date: (a) For the HVAC market effects study, there is a need to establish panel(s) of HVAC manufacturers, distributors and contractors to meet the research needs; (b) Other panels may be needed for other markets; (c) The HARDI data warrants re-negotiation and re-purchase; (d) The commercial refrigeration and multifamily retrofit markets need further market characterization prior to undertaking a market effects study; (e) It is possible to account for overlapping estimates of net savings from different studies in the non-residential new construction market; and (f) Market effects research needs to be closely coordinated with other research to avoid duplication of efforts, overburdening trade allies, and ensuring consistency.

4. **Code Compliance Support Initiative (CCSI)**. The CCSI seeks to improve code compliance in MA through various avenues over the long term. Current activities include formal trainings for builders, subcontractors and code officials, and one-on-one technical assistance on codes, building practices and design. The objectives of the CCSI evaluation, which began in late 2014, are to:
   - Develop and implement methodologies for evaluating the CCSI and tracking key indicators of impacts

- Ensure that the information necessary to fairly assess the CCSI effects will be available
- Gather interim data on the effectiveness of the trainings and one-on-one technical assistance on a regular basis to adjust and improve CCSI offerings
- Develop a methodology for estimating savings attributable to the CCSI efforts

Prior to the CCSI kicking off, the team conducted a 2014 Code Compliance Study for single-family non-program homes built at the end of 2006 and the beginning of the 2099 IECC code cycles. Beginning in the fall of 2014, the team began analyzing and reporting on surveys conducted with CCSI training participants and those who called for one-on-one technical assistance.

Key Evaluation Findings to Date: (a) Homes built at the end of the 2006 IECC cycle have significantly higher overall compliances scores than those built at the beginning of the 2009 IECC; (b)The code compliance study also found that the Pacific Northwest National Laboratory (PNNL) checklist does not adequately account for energy efficiency in its code compliance estimates; (c) The trainings and one-on-one technical assistances are viewed positively and the information is being used; and (d) The overlap in savings from different programs and savings estimates from different studies is considerable.

5. **C&I Non-Energy Impacts (NEIs).** NEIs include any positive or negative effects beyond energy savings that are attributable to energy efficiency programs. Examples of positive NEIs include reduced labor or non-labor O&M costs, and increased sales. Negative NEIs include increased labor or O&M costs, or reduced productivity or sales. The goal of this study is to provide guidance to the PAs and the EEAC by quantifying participant non-energy impacts (NEIs) associated with commercial and industrial new construction (NC) projects. The Stage 1 research was designed to determine whether NEIs from NC measures were best estimated from self-reports from participants and/or other market actors, engineering review, Delphi-panel, or other techniques and to recommend an approach for this Stage 2 analysis.

   Key Evaluation Findings to Date: (a) The Stage 1 study recommended that the analysis of NEIs associated with new construction measures should focus on true new construction only; (b) Self-reports by end users would not provide an effective means for estimating NEIs associated with most new construction measures; and (c) Instead, it recommended that an engineering-based approach is warranted to estimate NEIs.

   The objectives of the current Stage 2 analysis, which has just begun, are to:
   - Establish baseline conditions for NEIs
   - Quantify gross NEIs per unit of energy savings (both gas and electric) resulting from commercial and industrial new construction projects completed in 2013[10].

Behavior and Education

Behavior

The statewide research and evaluation activities in behavior and education has primarily focused on the evaluation of the residential behavior program, the Home Energy Report (HER) Program, implemented by Opower and first launched in MA in 2009. Three other behavioral initiatives implemented by the MA Program Administrators (PAs) have also been evaluated. In total, the statewide evaluation teams have measured the net impacts of over 31

---

10 NEIs include any positive or negative effects beyond energy savings that are attributable to energy efficiency programs.

unique behavioral program participant groups across multiple PAs, program years, and fuel-types (gas and electric) using experimental and quasi-experimental billing-based regression impact evaluations.

The evaluation findings demonstrate that behavioral program savings range from 0.82% to 1.87% per household for gas programs and 0.50% and 2.51% per household for electric households. The program savings associated with behavioral program efforts, in particular the HER programs, have produced reliable savings. In response to reliable and replicable savings impact values, the PAs have established realization rates for their HER programs.

The MA PA's have also funded multiple rounds of process evaluation research, including survey research among program participant and control customers, in-home and in-depth interviews with program participants, and experimental research to determine the marginal savings impacts of varying engagement strategies.

Finally, in 2014/2015 the MA PAs funded a research project in which a comprehensive review of residential and small/medium commercial behavioral programs across the United States and Canada was conducted. This research also explored behavioral programs implemented in small markets.

Education

The statewide research in education has primarily been targeted at the Building Operator Certification (BOC) program and around K-12 energy education programs. Most recently, a process evaluation was completed for the BOC which included a literature review of savings estimates resulting in recommended savings values. The MA PAs have also funded research projects in which a comprehensive review of K-12 energy education programs was conducted. The most recent review (completed in 2015) included K-12 programs with behavioral interventions.

Community-Based Initiatives and Statewide Marketing

Community-Based Initiatives

Opinion Dynamics has conducted several major studies since 2011 to evaluate community-based initiatives across Massachusetts. These studies assessed initiative processes, impacts, and incremental costs. The specific evaluation efforts included:

1. Process and limited cost evaluation of Renew Boston and New Bedford Community Mobilization Initiative
2. Process, impact, and all-in cost assessment of the Powering Pittsfield and Leading the Way Northampton Initiatives (under EE2020 umbrella)
3. Process, impact, and incremental cost assessment of the Efficient Neighborhoods+ Initiative

The evaluation studies answered a range of important questions including identifying best practices to planning, designing, and implementing community-based initiatives and assessing incremental costs associated with administration of such initiatives.

The research efforts to date focused on the evaluation of one-off distinct community-based initiatives and did not attempt to take a cross-cutting view or answer some key overarching questions about these initiatives. Several of these questions emerged during the 2015 Program Administrator Planning Summit and ongoing evaluation planning discussions. A particular topic of interest was defining the roles and objectives that PAs envision community-based initiatives will serve. A related question is what defines a "community" in the context of a community-based initiative. Communities could be defined by demographics, geography, common interests, or the work of a specific community organization.

The success of future community-based initiatives will greatly benefit from additional research into the comparative effectiveness of the various community-based design elements, as well as messaging and marketing strategies in driving participation and depth of savings among different customer segments.

Through the past research, we have learned that community-based initiatives often result in considerable incremental costs that could prevent implementing them on a broader scale. Understanding which community-based initiative designs are scalable and lend themselves to broader implementation, collecting incremental cost data, as well as assessing the reduction in incremental costs associated with scaling the initiatives will provide PAs with powerful insights into planning and designing future initiatives.

Statewide Marketing

Between 2010 and 2015, Opinion Dynamics conducted a number of research activities to evaluate the statewide marketing of energy efficiency programs. Massachusetts-based energy efficiency Program Administrators collectively implemented the marketing campaign under the trademark of Mass Save®. The primary evaluation activity was a series of tracking surveys with residential and commercial customers. The surveys measured customer awareness, knowledge, and associations with the Mass Save brand and the effectiveness of marketing activities. Opinion Dynamics also conducted surveys with trade allies to assess their knowledge of Mass Save, Gas Networks, and Cool Smart brands.

Just over half of residential customers (54%) and two-thirds of commercial customers (66%) were aware of Mass Save at the beginning of 2015. Among residential customers, the early 2016 survey documented the first statistically significant increase in Mass Save awareness since the first tracking survey was conducted in early 2012 when awareness was 39%. During this same time, awareness among commercial customers doubled (33% to 66%). Customers who were aware of the brand said that they felt the campaign messages were clear and communicated that the brand could help them lower their energy bills (69% of commercial customers and 77% of residential customers in January 2015).

Past research efforts have focused on brand awareness as a metric of program success. Future research could explore whether additional metrics are useful, what target levels are appropriate, and how much time and effort is needed to hit targets. Additional metrics could move beyond brand awareness to assessing the impact of statewide marketing on program participation and energy savings.

Past statewide marketing has been broad-based. Future research could explore whether more targeted marketing would be a better strategy. Targets could be defined by demographics, customer attitudes, potential energy savings, or communities, to name a few. Likewise, most marketing has targeted end-users, but future research could explore whether targeting trade allies would be a more effective marketing strategy.

2. NEAR-TERM PRIORITIES

February 2015 Planning Summit

To encourage early participation in the evaluation planning process, the PAs hosted a strategic evaluation Planning Summit in February 2015. The Planning Summit provided a forum for the PAs, EEAC Consultants, and evaluation contractor teams to identify emerging evaluation topics and activities. As a group, these stakeholders then developed a preliminary assessment of each research area's relative priorities.

It became clear during the Planning Summit that as programs have matured, they have been studied in a commensurate manner. In many areas, results have started to stabilize. While previously studied factors remain important and will continue to be studied, it may not be necessary to study them at the same frequency as was previously done. This does not mean that impact or similar evaluation methodologies will no longer be employed, as they are essential to the proper functioning of EM&V, but this does present an opportunity to research new topics and areas that can help PAs optimize program performance and program delivery.

One of the recurring themes throughout the Planning Summit was that evaluations need to better identify implications for program design moving forward. In order to ensure that evaluation dollars are being spent wisely, studies must have a practical application to current or future programs. Another goal that was identified was to shorten the timeframe between when research is done and when it is presented to implementation teams so that implementation teams can more quickly and better leverage evaluation results. These themes will help guide future evaluation development.

The Near-Term Priorities listed in the sections below were generated through collaborative discussions at the February Planning Summit and subsequent discussions with stakeholders. As this Strategic Plan evolves going forward, it is anticipated that the individual points outlined in Sections 2.1, 2.2, and 2.3 will be refined and expanded upon.

In order to maintain alignment with the three year planning cycles, it is anticipated that Evaluation Planning Summits will continue to be held prior to the beginning of new three year cycles in order to support subsequent planning activities.

2.1 RESIDENTIAL

The work in this research area is currently led by The Cadmus Group, Inc. The Cadmus evaluation contractor team also includes Navigant, NMR Group, Inc., DNV GL, Tetra Tech and Dorothy Conant Consulting as subcontractors. This evaluation team was selected through a competitively procured joint RFP process conducted in the spring of 2013. The current Cadmus team has been awarded the contract through June of 2016. Each research area and study has an assigned PA staff member and EEAC Consultant covering it.

This research area is currently led by an Eversource employee with seven employees representing two PA organizations currently leading studies in this area.

2016-2018 Residential Priorities

The identified priorities for the Residential research area are outlined below. In addition to the priorities outlined below that were developed during the evaluation planning process, issues surrounding equipment baseline have also been identified as a priority and are described in greater detail in Appendix B.

Residential Lighting:

- Better understand to what extent different types of light bulbs are going into sockets
    - How will these trends impact lighting as a percentage of overall home energy use?
- Determine the optimal strategy and timeline for supporting or discontinuing support for CFLs
- Determine whether the MA programs are bringing about long term changes in the structure and functioning of the lighting market
- Understand how manufacturers', retailers', and customers' decisions affect the lighting market
    - Bulb replacement strategy, bulb storage, perceptions, knowledge, response to lighting options, pricing, adoption of LEDs

Residential Products:

- Identify which products PAs should support going forward and how the PAs should support them
    - Technology assessment, program design, product recycling
    - E.g. incentives, marketing, standards advocacy, upstream
    - E.g. gas fireplaces, power strips, set-top boxes
- Determine the opportunities for home automation
    - Wi-Fi & lighting, interconnectivity, DR, NEIs, peak load
- Continue to support the development of new sources of savings by evaluating new pilots and initiatives

Residential Heating Equipment

- Boiler Installations (Lost Opportunity)
    - How can these be improved to capture lost opportunities identified through evaluation of installed condensing boilers?
    - Can smart thermostats improve the performance of high efficiency (i.e.., condensing) gas boilers?
- Oil retrofits
    - Establish accurate baselines for early replacement, etc.
    - Identify opportunities for efficiency gains
    - Identify opportunities for savings associated with Maintenance/quality installation savings
    - Program delivery issues – can we make sure people get offered fuel switching opportunities at key times (LI, new pipeline, equipment failure, targeting at non-gas areas)
- Hot Water-- Contractor knowledge/stocking practices
    - Do contractors regularly stock high efficiency equipment?
    - What would it take to change their behavior?
- Heat Pump Water Heaters
    - Establish the proper baseline/energy code
    - Interaction with heating/cooling system
    - Savings by unit type/efficiency
    - Market channels/Upstream opportunities
- How knowledgeable are DMSHP installation contractors?
    - Are they selling cold climate units when appropriate?
    - Are the contractors sizing the units correctly?
    - How are they educating homeowners on optimal operation?
    - Is the incentive structure appropriate?
- What is the potential for Smart Devices/Controls/Thermostats?
- Have we identified all relevant non-energy impacts from equipment?

Home Energy Services (HES)

- How can the program optimize limited time in the customers' homes?
    - How much is too much information? When do we lose customer's attention? Contractors?
- How have the insulation/air sealing savings changed (including realization rates)?
- What opportunities exist for home automation savings?
- Does program participation increase home resale value?
- How can evaluation leverage/utilize the inspection and quality control data already being collected?
- Improve our understanding of patterns of equipment adoption and how customers interact with other programs in addition to HES
    - Understand if patterns of equipment adoption and interaction with additional programs vary by delivery channel results (lead vendors, home performance contractors, and independent installation contractors)
    - Inform the evolving program design

Residential Multifamily

- What are the relevant indicators to assess the program's performance, particularly regarding residential/commercial cross-participation?

    - Are the data available to support this? If not, what do we need?
- Are there opportunities to provide customers with cost information and/or building labeling to overcome landlord/tenant issues?
- Should the program serve condo customers differently?
- Would structural changes to the different res/C&I claimed benefits increase cross-sector participation?

2.2 NON-RESIDENTIAL

The EM&V work in this research area is currently conducted by an EM&V contractor team led by DNV GL's Energy and Sustainability group with Apprise, DMI, ERS, Illume Advising, Itron, NMR Group, Inc., SBW and TetraTech, as subcontractors. This evaluation team was selected through a competitively procured joint RFP process conducted in 2014-2015. It is anticipated that the term for this contract will end mid-2018. Each research area and study has an assigned PA staff member and EEAC Consultant covering it.

This research area is currently led by a National Grid employee with six employees representing two PA organizations currently leading studies in this area.

2016-2018 Non-Residential Priorities

The identified priorities for the Non-Residential research area are outlined below. In addition to the priorities outlined below that were developed during the evaluation planning process, other global priorities have been identified and include:

- Support the efforts of program implementers to broaden and deepen the savings achieved, and to meet savings goals
- Better understand the drivers of differences in outcomes across PAs
- Conduct studies to inform the development of segment-focused efforts

Impact Evaluations:

- Systematic impact planning
    - Do we want to look into continuous measurement evaluation approach?
    - Are we properly accounting for the inter-relationship between net to gross studies and changing baselines (upstream lighting)?
- Specific studies
    - Upstream lighting (and HVAC)
    - Comprehensive Design Approach (CDA)
    - Measure life

Market Assessments:

- How can we effectively target mid-size customers to increase participation and savings?
- Emerging Technologies-- What is missing from programs' current mix of measures? What's in the pipeline for manufacturers, PA programs, other programs?
    - Example measures: lighting controls, heat pumps, plug loads, retrocommissioning, others?

Process Evaluations:

- How can the PAs expand program activity in the microbusiness sector?

  - Looking at non-MA external best practices, Main Street pilots, online portals, OPower-type benchmarking, trade associations, language barriers.
- How can we develop long-term engagements with customers, especially mid-sized customers, to increase lifetime value?
- How can the PAs coordinate with vendors to achieve deeper savings within various fuel types?
- What types of coordinated data collection (e.g., baseline info, data tracking info) is needed to facilitate the evaluation of upstream programs?
- How can the PAs better integrate the C&I and residential multifamily programs?
- Are there electric and gas integration best practices that can be learned from either external (outside MA) or internal (e.g. MA program implementation contractors and PA sales staff) sources?

2.3 CROSS-CUTTING

Currently, Cross-Cutting research is divided into three broad areas and each area is served by a different EM&V contracting team. The evaluation teams were selected through a competitively procured joint RFP process conducted in 2013-2014. The term for this contract will end mid-2017. The research areas and contracting teams are outlined below.

- Net-to-Gross, Market Effects, Top-Down Modeling, Codes & Standards, and NEIs
  - Prime Contractor: Tetra Tech
  - Subcontractor: NMR Group, Inc., DNV GL, and the Cadmus Group
- Behavior and Education
  - Prime Contractor: Navigant Consulting
  - Subcontractor: Research into Action, Illume Advising, and Bellomy Research
- Community-Based Initiatives and Umbrella/Statewide Marketing
  - Prime Contractor: Opinion Dynamics Corporation
  - Subcontractor: Evergreen Economics

A representative of Eversource is currently the statewide research area manager, with seven employees from four different PA organizations leading individual study efforts.

2016-2018 Cross-Cutting Priorities

As the savings goals have ramped up, the program implementers have turned increasingly to integrated programming efforts that are not specific to either customer sector. Examples include community-based programs, umbrella marketing, and integrating behavioral aspects into existing programs. The Cross-Cutting research area has been the focal point for evaluation of these efforts. The PAs anticipate leveraging research in the Cross-Cutting area to help increase program effectiveness and meet aggressive savings goals.

The near-term priorities for Cross Cutting are as follows:

Behavior & Education:

- Do behavior change initiatives targeting one fuel-type have an impact on other fuel-types (i.e., are there cross-fuel impacts)? How can the PAs measure and claim cross-fuel impacts resulting from behavior change initiatives?
  - Are there gas savings associated with electric-focused behavior change initiatives? Are there electric savings associated with gas-focused behavior change initiatives? Are there oil savings associated with electric or gas-focused behavior change initiatives? Are there water savings associated with electric or gas-focused behavior change initiatives?

- What are the opportunities for leveraging behavior-based strategies in the context of Demand Response (DR) and time-varying rates?
  - What are the demand savings associated with behavioral programs and can they be claimed?
  - What is the opportunity for leveraging behavior-based strategies with time-varying rates to achieve demand savings? (e.g. Will they be accepted? Will customers respond?)
  - Can targeted conservation and DR activities be used to alleviate grid constraint? If so, how?
- How can Massachusetts use behavior-based strategies to innovate and increase portfolio savings?
  - What are the behavior-based strategies that can be overlaid on existing programs? (e.g. direct installs)
  - How can behavior-based strategies be leveraged to generate and claim greater savings?
- What are the savings opportunities for behavior-based initiatives targeting operations and maintenance (O&M)?
  - E.g., retrocommissioning, residential maintenance
  - What are the underlying barriers by sector that prevent persistence of the changes in O&M behavior?

Statewide Marketing:

- What should the success indicators be for energy efficiency marketing efforts?
  - Is Mass Save effective?
  - Potential indicators:
    - Brand awareness?
    - Program participation?
    - Energy savings?
  - What is the appropriate timeline for moving from simple customer awareness of the Mass Save brand to energy efficient action?

Community-Based Initiatives (CBI):

- Determine the role of CBIs/what are the PA goals as related to CBIs?
  - Testing new program design concepts, energy efficient technologies, marketing and outreach tactics?
  - Increasing program participation?
  - Achieving greater energy savings per participant?
- What do program implementers need to know about community-based programs in order to make a decision about whether to continue to support them?

Top-Down:

- Determine how Top-Down modeling results can be used in conjunction with market effects and net to gross (NTG) results in planning, program design, and attributing energy savings to energy efficiency programs
  - How can Top-Down results be used to provide evidence to support or refute the results of market effects or NTG studies?
  - How do we ensure that we are doing work that is meaningful and not duplicative of other research studies or areas?
  - How should we effectively communicate the results to stakeholders?

Net to Gross/Market Effects:

- Should we pursue additional research with a panel(s) of manufacturers, distributors, and/or contractors to collect sales data necessary to quantify Market Effects?
  - Lighting, Multifamily
  - Can the panel also be used to collect information to support process evaluations?
- How can we improve the development and application of prospective NTG ratios?
- How do we use findings from NTG and Market Effects studies for program planning and design?

3. LONGER TERM PRIORITIES

3.1 OTHER 2016-2018 RESIDENTIAL TOPICS OF INTEREST

Additional topics identified as of interest but not an immediate priority included:

Residential Lighting:

- How can we leverage other research efforts in order to update hours of use estimates? What is the potential for replacing linear fluorescents with linear LEDs?
- Determine how to best plan for EISA II being implemented or EISA I being rolled back (political uncertainty)
- Develop savings projections based upon anticipated changes in:
  - Measure life, delta watts, early replacement, hard to convert fixtures, takeback, NEIs
- Determine the trajectory for incremental costs
- Issues surrounding channels:
  - How do sales differ by channel? (including online)
  - Do we need channel specific strategy?
  - Would this cause channel shifting?

Residential Products:

- Are there spillover effects of product support onto other measures? Is PA support of certain energy efficient products creating an uptake in other efficient products?

Residential Heating and Hot Water Equipment:

- Moving people to condensing equipment
  - How can programs influence people to change from non-condensing to condensing equipment?
    - Incentive levels and structure?
  - What's the appropriate baseline for that type of program design?
- High Efficiency Gas Water Heaters
  - Savings – do we capture standby losses accurately?
  - Instantaneous water heaters – are the savings correct?
- What is the baseline for Central A/C?
- Ducted cold climate HPs
  - Savings
  - Baseline
  - Contractor awareness and installation practices
- What are true incremental costs and lifetimes of equipment?
- Are there upstream program design needs?
- Are there market effects that need to be considered in NTG?

Home Energy Services:

- What can we learn from further mining and developing program delivery indicators?
- Are there non-DSM opportunities that could be integrated into the HES program (ex: roof top PV)?
- Can we improve the forecasting of net-to-gross (NTG) values for HES? How has the NTG for HES changed?

Residential Multifamily:

- How different are oil customers from gas customers?
    - Is leveraging gas research appropriate, or do we need oil-specific primary research?
- Why is there a difference in lighting installation rates between PAs?

3.2 OTHER 2016-2018 NON-RESIDENTIAL TOPICS OF INTEREST

Impact Evaluations:

- Custom gas
- Small Business Direct Install (DI) programs
- Usage of ductless mini-splits in C&I sector
    - What is true baseline?
- Pre/Post Evaluation[11]
    - Expand pre/post metering for controls oriented measures? (Previously did lighting controls, Variable Speed Drives (VSD))
- Review impact evaluation of other commercial behavioral program evaluations with goal of setting interim savings levels for future MA programs

Market Assessments:

- What customer characteristics or third-party data should be incorporated into future studies? What are the implications on other studies?
- How do energy use intensities (EUI) differ by geography and building type over time? What drives the differences?
- Can microbusinesses be targeted by behavioural initiatives, residential strategies or other approaches?
- Supply Side
    - How do we systematically collect data from market actors, especially sales data? What drives participation in data collection efforts?
    - What are the key characteristics of market actors for Heating, Ventilation, and Air-Conditioning (HVAC) controls and building automation, in particular knowledge and training?

Process Evaluations:

- How would the results of the mid-sized customer needs analysis change if multiple years of data were included in the analysis (e.g., incorporating impacts from upstream programs)?
- Are mid-sized gas customers being optimally served by existing programs and marketing strategies?
- How can we leverage the PA program tracking databases to inform marketing to mid-sized customers?
- What barriers are causing customers to drop out of the participation process?

---

[11] During pre/post evaluation, on-site visits are coordinated to gather metered data before and after the installation of an energy efficient measure. Metered data, installation and operation information, and weather data, concurrent with the monitoring period, are used to calculate savings.

- Which HVAC technologies are best suited to an upstream program and why?
- How well does MA match up with other states in terms of trade ally best practices?
    - How do we address any identified barriers?
- Combined Heat Power (CHP) process evaluation
    - What are the barriers and lessons learned from previous MA CHP projects?
    - Are there CHP best practices in other states that can be incorporated into MA programs?

3.3 OTHER 2016-2018 CROSS-CUTTING TOPICS OF INTEREST

Behavior & Education:

- Can and should the measure life of behavioral measures be extended (i.e., do behavioral savings persist after the program/behavioral intervention has been suspended)?
- What are the energy saving opportunities for behavior-change models among different customer classes?
    - Examples of different types of customers: Small/Medium C&I, Large C&I, K-12, Higher Education, Low Income
- How can we foster emerging technologies that target behavior change to generate sustainable savings?
    - What is the opportunity for home automation (conservation, efficiency, DR)?
    - Which customer classes are the best targets for new technologies?

Statewide Marketing:

- What is the impact of having multiple competing brands and marketing campaigns promoting energy efficiency?
    - Examples: individual utilities, Mass Save, Energy Star
    - Are they mutually reinforcing? Do they compete with each other?
- What tactics are most effective for marketing energy management?
    - What has been done and what else could be done?
    - What tactics have other successful energy efficiency marketing campaigns used?
- What is the most appropriate marketing strategy for the Mass Save brand?
    - Broad based marketing that attempts to reach all customers versus targeted marketing that attempts to reach specific customers based on likelihood to participate in programs, energy savings potential, or other characteristics?
- Who are the appropriate targets for marketing the Mass Save brand?
    - What is the appropriate balance between targeting contractors versus customers?
- How should PAs define customer segments?
    - Demographics?
    - Attitudes?
    - Community?

Community-Based Initiatives (CBI):

- How can CBIs be used to enhance existing programs, engage more customers, and achieve greater energy savings per customer?
- What is the comparative effectiveness of the various CBI design elements in driving participation/greater energy savings per customer?
- What is the relative effectiveness of the various marketing and messaging strategies in inducing participation/greater energy savings per customer? How does the effectiveness of different marketing strategies vary by target audience/community?
- What are the effective community-based designs/models to engage non-residential and multifamily customers?
- What is the value of increased incentives in driving participation/greater savings per customer?

Top-Down:

- How can we address the key econometric concerns with top-down models going forward to make the results more precise?
  - How do we test hypothesis and discern incremental impacts?
  - How do we assess model specifications?
- How and when should we refine the current models and re-estimate?
  - How do we construct a PA-Municipal Utility model that will result in a tighter confidence interval around the savings resulting from programmatic activity (expenditures) by the PAs and Munis?
  - At what point would re-visiting the PA data model be desirable if we continue to compile PA tracking and consumption data going forward?
- What is the appropriate approach to bringing in data from other states to incorporate into a model?
- Should we construct different types of models and how can these different results inform program/policy questions?
  - Should the model type be focused on comparing electric use in PA service territories vs. municipal electric service territories?
  - Should the model type be focused on comparing Massachusetts to other states? What is the appropriate approach to bringing in data from other states to incorporate into a model?
  - Should the modeling efforts focus on other fuels besides electricity?

NTG/Market Effects:

- Updating baselines
  - How do baseline levels of efficiency of energy-using equipment affect NTG and market effects?
  - How do non-energy efficiency market trends affect baselines?
  - Measuring Upstream impacts comprehensively
- How do customers' structural characteristics affect NTG?
  - Should Memorandum of Understanding (MOU) customers and Chain/Franchise customers be treated the same as other customers in NTG calculations?
- Market effects for other types of equipment besides HVAC and Lighting
  - Building Shell, HVAC Controls, Whole House, Cooking, Boilers, Refrigeration
- Understanding changes in new construction market
  - Opportunity to understand program influence on low-energy buildings
- Should we move to systematic advance scheduled data collection?
  - Rolling data collection
  - Regularly timed data collection

4. PLANNED RESEARCH AND STRATEGIC ISSUES

Research highlighted in this Strategic Evaluation Plan includes studies which are in the Stage 1: Conceptual Framework planning stage (detailed descriptions of research stages can be found in Section 1.9). A number of these studies, particularly for C&I, are in the more advanced stages of Stage 1 plans. Note that studies that are already underway are not discussed here; this document, therefore, is focused on new, prospective research to get underway in late 2015 and in 2016-2018.

In addition, we do not view this as a definitive list of future studies, but as a roadmap for future research that was developed as part of the planning process. Some of the proposed studies may not make it past Stage 1, some may change significantly as they enter Stage 2 and Stage 3 work plan development; plus, new studies are expected to be added as priorities shift and new priorities arise over the next three years. As noted in Section 1.6, flexibility is one of the key principles considered when establishing the evaluation research portfolio.

As part of the evaluation planning process there have also been extensive discussions regarding strategic issues, including how multiple components of evaluation research fit together, key research questions that the proposed studies will address, and additional research areas that are not currently proposed but may be worth adding in the future. Examples of these are provided below.

4.1 RESIDENTIAL STRATEGIC EVALUATION ISSUES

Residential Customer Profile Study

The Residential Customer Profile Study (RCPS) compiles PA, implementer and third party information into a central database that can be mined for insight on patterns, trends or insights such as the:

- Distribution of program participation
- Distribution of savings by region
- Savings by market segments or demographic characteristics

The first RCPS report was finalized in October 2015 presenting the results of the analysis of the 2013 programs. Future iterations of the report will include an assessment of multi-year patterns and trends.

Advantages

The immediate objective for the RCPS is to illustrate the accomplishments of the PAs' energy efficiency programs. The ultimate possibilities for this study include:

- Details and analysis that enable the PAs and implementers to optimize program design and delivery.
- Data to support models that predict program participation, savings, net-to-gross ratios and customer satisfaction.
- Transparency to stakeholders and the public on the effectiveness and return on investment for energy efficiency in Massachusetts.

Going Forward

As additional years of program data and additional sources of data are collected, new hypotheses can be tested and questions researched. Examples include:

- How are savings by PA in a given year being impacted by previous program participation (saturation)?
- How is savings distribution impacted by housing type within census regions?
- What is the theoretical remaining opportunity for savings in different regions or territories by program?
- Based upon previous program participation and adoption, where should implementation be focusing efforts?

Home Automation Research

Home automation as an energy management strategy is becoming increasingly popular as a variety of home energy management systems (HEMS) enter the market. A 2015 HEMS market characterization identified 244 HEMS products available, ranging from smart controls for lighting, HVAC, and appliances to load monitoring and energy analytics software that can be integrated with renewables and energy storage. According to a 2015 market outlook, home automation product market revenue is expected to grow significantly in the coming years, from $7.3 billion to $67.7 billion between 2015 and 2025.

Key opportunities for evaluation in home automation include:

Creating Savings Opportunities. HEMS provide new opportunities for controlling home devices to save energy and reduce peak loads. One example is smart thermostats. Smart thermostats use occupancy sensors or geo-location services with background algorithms to learn user behavior and automatically control heating and cooling. By doing so, they can automatically reduce heating and cooling when the home is unoccupied and take advantage of savings without compromising comfort. In addition, they provide a platform for utilities to administer direct load control, behavioral demand response, and pricing programs that can reduce peak demand.

Identifying New Savings Opportunities. HEMS products provide opportunities to identify underperforming equipment in the home. The performance data collected on smart thermostats, for instance, can be used to diagnose poorly performing HVAC systems or leaky homes. By identifying opportunities for energy-efficiency improvements, they can help program administrators target energy-efficiency program offerings to the appropriate customers.

Accelerating EM&V. Many HEMS products provide an alternative EM&V method by collecting interval data, even in the absence of advanced metering infrastructure. These interval data can be leveraged as an EM&V tool to evaluate savings from measures installed in a home or demand savings from direct load control, demand response, or pricing programs. In addition to energy data, some provide other appliance performance metrics, such as system run time or home temperature. With intervals often at the one-minute level being collected on a real-time basis, program EM&V can benefit both in terms of speed and rigor. Analysis of these data can also help identify program issues mid-cycle, such as problems with contractors or underperforming measures, so they can be fixed mid-cycle.

Engaging Customers and Enhancing Services. Home automation can also help engage customers while providing them with an energy management service they are already looking for. Results from a 2014 home automation market survey, including data collection nationwide, indicate that consumers are already interested in opportunities to save energy through home automation. The study found that “automated energy savings” was the number one reason survey respondents were considering home automation. By engaging customers with an energy management technology they are already interested in, program administrators can initiate a re-engagement cycle to improve programs and maintain customer participation.

4.2 COMMERCIAL AND INDUSTRIAL STRATEGIC EVALUATION ISSUES

C&I Customer Profile Project

The annual C&I Customer Profile project analyzes PAs’ billing and tracking data to provide nuanced insights into the population and participation trends characterizing the Commonwealth’s C&I energy efficiency programs. The foundation for this analysis is the C&I Evaluation Database—a tool supported by the PAs and EEAC Consultants, and developed by the non-residential evaluation team—which collects and standardizes multiple years of data from all Massachusetts gas and electric PAs. This database provides clean data sets to contractors conducting evaluation studies in the C&I, residential, and cross-cutting research areas.

Each year (since 2012, using 2011 data) a Customer Profile report is published to present an up-to-date view of C&I program trends, including the types and quantities of customers participating and contributing the most program savings. Statistical trends are reported for a range of metrics at different levels of granularity—including statewide, by PA, and within PA—to provide both broad and detailed views of the C&I efficiency landscape (see the figure below for a visual representation of this analysis).

The PAs and EEAC can also query the C&I Evaluation Database to obtain efficient, data-driven answers to ad hoc research requests, and the current Customer Profile project (using 2011-2014 data) includes a new task whereby DOER is provided with granular data for analysis (while still maintaining customer-level confidentiality). As part of this ongoing project, the non-residential evaluation team has introduced a series of monthly working group meetings with the PAs and DOER to review preliminary results, troubleshoot potential issues early in the process, and expedite project completion to provide timely insights to program implementation teams.

Advantages

The C&I Customer Profile project provides valuable features that help to improve the efficiency and performance of the Massachusetts non-residential programs. These features enable the PAs and EEAC to:

- Examine changes over time. The C&I Evaluation Database is populated with four years of consistent, standardized PA billing and tracking data. This data is updated and cleaned each year to support reliable, up-to-date comparisons of program participation and savings over time (e.g., savings achieved by the Healthcare sector between 2011 and 2014).
- Ensure confidentiality. The annual Customer Profile studies preserve PAs' customer and IT system confidentiality while allowing PAs to evaluate how their standardized data compares to the standardized data for other PAs and the state as a whole. The data transfer site allows for efficient, secure data transfer with PAs, other evaluation firms, and stakeholders.
- Pinpoint savings opportunities. PAs' billing and tracking data is supplemented with GIS libraries and tax assessor data to identify and target specific areas and customers with high savings potential. Maps from the 2014 Customer Profile report show that the Accommodation and Food Service sector had consistently higher energy use intensities (EUIs) on the Cape than in any other region of Massachusetts. This may represent an opportunity for account-level targeting for efficiency measures, or a more blanketed marketing push.
- Enforce timeliness and coordination. Over the course of four Customer Profile studies, the non-residential evaluation team has refined its approach to ensure regular communication and early presentation of results. This engagement has led to shorter timelines, deeper PA insights into trends and findings, and more advanced analysis.
- Efficiently identify and analyze research questions. The annual Customer Profile reports often identify key researchable questions for subsequent study, and the C&I Evaluation Database provides a common collection and storage point for data that can be leveraged across all non-residential evaluation activities, including impact evaluations, market assessments, and process evaluations. Using a common data source also ensures consistency and comparability across studies.

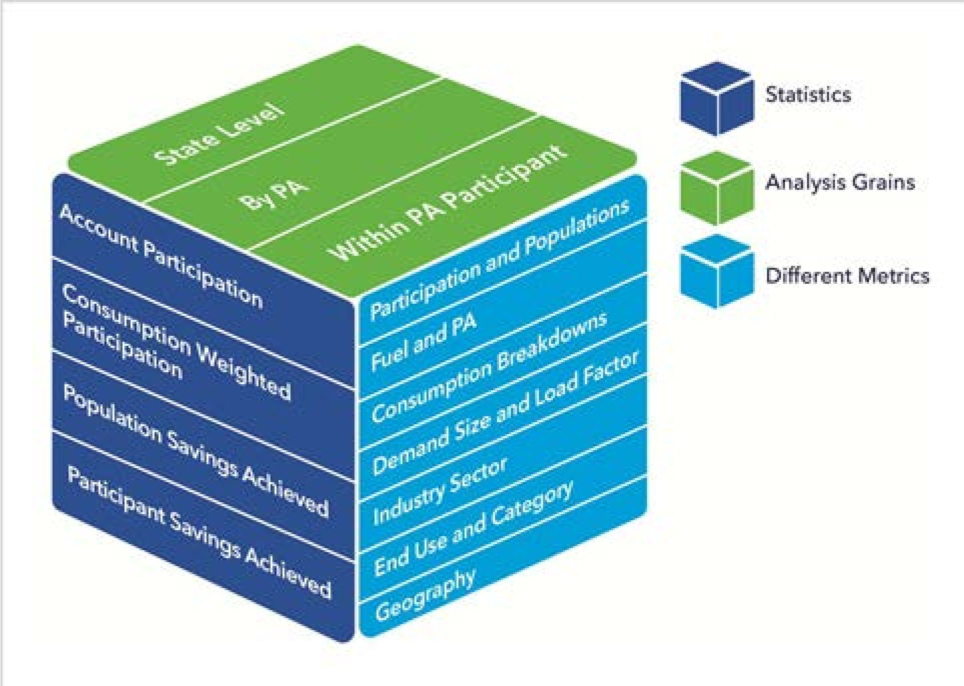
Going Forward

In early 2015, the non-residential team investigated the feasibility of integrating new, third-party data attributes into the C&I Evaluation Database to enable even greater analysis capabilities and the generation of customer-level views (as opposed to account-level views) across PAs and fuels. These enhancements are a prerequisite for conducting more advanced analyses, including:

- Identifying opportunities for deeper measure-level penetration
- Developing profiles of customers who are likely adopters
- Developing a predictive model to quantify the likelihood of measure adoption and expected savings based on customer-specific traits across PAs and fuels
- Building a more comprehensive picture of likely customer attitudes towards efficiency offerings that can be leveraged by additional PA teams, including marketing and account managers

These types of analyses can provide a more complete picture of how different accounts are related to each other, a better understanding of the characteristics of individual accounts, and greater clarity and more focused/actionable recommendations that the PAs can pursue to increase their return on efficiency investments. Database enhancements will also allow the PAs and EEAC to more effectively evaluate the integration of electric and gas programs.

Visualization of the Analysis Cube used for the Customer Profile Report



Refinements to Gross Impact Evaluation Framework

This initiative seeks to refine and more fully document the approach used to determine which Massachusetts C&I impact evaluation studies to undertake, at what level of rigor, and when.

Focused on impact evaluations, this effort is an outgrowth of the substantial planning and documentation work undertaken by the PAs, EEAC Consultants, and non-residential team in Annual Planning meetings (since 2011), in the development of Massachusetts Statewide Electric and Gas Energy Efficiency Evaluation Plans (since 2013), and in evaluation studies quantifying the energy savings impacts of Massachusetts energy efficiency programs for more than two decades.

Historically, evaluators have considered the proportion of savings from programs/measures, proportion of dollars invested, uncertainty, the last time programs/measures were evaluated, and other key factors to identify good candidates for impact evaluations and the appropriate level of rigor for each study. While this approach uses sound logic, the PAs and EEAC Consultants recognized the need for a better-documented decision-making framework and "roadmap" to maximize the value of impact evaluation studies now that the statewide C&I programs and evaluation framework have matured.

This initiative will enable the PAs and EEAC Consultants to:

- Identify and resolve the sometimes-competing priorities that affect planning decisions. The contractor team will document the full range of stakeholder objectives for impact evaluations, and will work with the PAs and EEAC Consultants to prioritize these objectives to more clearly guide future planning decisions.
- Save time and effort by developing a consistent set of indicators and a scoring system to substantiate future research decisions. A preliminary list of indicators developed by the evaluation team includes the following:
    - Relative magnitude of savings tracked or expected from the study population compared to the portfolio
    - Time since the study population was last researched

  - Amount of variability in historical impact evaluation results
  - Changing and/or new technology
  - Confidence in tracking savings value
  - Confidence in utilized evaluation results
  - Confidence in measure or project baselines used
  - Changing industry standard practice, code, baselines
  - Changes in program delivery
- Efficiently determine the appropriate analytical method and level of rigor for each study. The initiative will document various research methods, and the benefits and drawbacks of each method—including which evaluation objectives they achieve well. This resource will enable the PAs and EEAC Consultants to quickly and systematically assess the best approach for each study.
- Establish a uniform process and terminology to assess evaluation needs. In order for the PAs and EEAC Consultants to implement a successful approach to planning, the group needs to be able to articulate why it makes sense to pursue a specific research scope at a given time. The final document delivered as part of this project will establish shared terminology, describe the agreed-upon approach for planning impact evaluations, and provide basic instructions on how to follow it. While moving more toward standardization, the recommended approach will include sufficient flexibility to account for exceptions.
- Improve planning in other research areas. While this initiative is primarily focused on improving planning for C&I impact evaluation studies, the research and documentation can be leveraged to improve planning in other research areas, as well.

This project is currently under development, with the PAs, EEAC Consultants, and Evaluation Contractor actively discussing the issues involved and determining the appropriate method to resolve some threshold issues. For these reasons a specific Stage 1 Work Plan is not included in this document. The evaluation team expects to be fully engaged in this process by the first quarter of 2016 enabling them to utilize the results of this effort as the 2016 year progresses.

Refining the Framework and Practices for Establishing Baselines

Equipment, operations and energy consumption baselines are the foundation for accurate energy savings estimates. Baseline assumptions must be made on an ex-ante basis in the planning stage, and then often vetted on an ex-post basis in the evaluation stage. The rules for establishing ex post baselines should follow principles that apply to all programs, both gas and electric, prescriptive and custom. Impact evaluations have produced a variety of scenarios over the years requiring the development of principles and protocols which are reflected in practice. Evaluators, PAs, and the EEAC consultants have observed inconsistency in baseline characterizations and the methods used to determine them. In response to some of these inconsistences, the Baseline Working Group has been established by the Evaluation Management Committee to clarify new construction or end-of-life baselines where code applies.

In coordination with the efforts of the Baseline Working Group, the C&I Evaluation Team will develop a document articulating the principles by which evaluation baselines are defined and used to calculate savings and the process by which baselines are set for C&I measures (although the effort will be coordinated with the residential sector and it is expected the document could be leveraged for residential programs). The document will be a concise definition of terms, statement of principles, and outline of procedures. This is intended to be a short, living reference document. Since it is expected that there may be differences of opinion about what these principles and protocols should be, a stakeholder process will be required to reach a final decision.

The C&I Evaluation Team’s efforts will address the following methodological approaches and/or questions:

- What are the baseline assumptions built into baseline system forecasts, the EEAC goal setting and planning?

- Where code exists, is baseline for new construction/normal replacement code or standard practice or something different, such as a hybrid? (This will be informed by the Baseline Working Group findings.)
- Where code does not exist, should the baseline be standard practice or the lowest cost, feasible, reasonable alternative?
- What is the best way to account for late in life replacements – dual baselines or through some other mechanism?
- What is the protocol and evidentiary standard for establishing a measure as an early vs. normal replacement?
- For early replacement, how should the remaining useful life (RUL) and incremental cost be calculated?
- What is required by implementation to define the specific existing conditions for a site?
- What is the protocol for establishing a market baseline (either standard practice of least cost, feasible, reasonable baseline)?

The study activities will include research and documentation of practices in other jurisdictions, a definition of the Massachusetts landscape (current practices where there is consensus and those areas where clarity is needed), a straw man proposal including presentation of multiple options/opinions, facilitation of a stakeholder process, and production of a final baseline document meeting the needs of the stakeholders.

4.3 CROSS-CUTTING STRATEGIC EVALUATION ISSUES

There are a variety of methods that can be used to estimate net savings attributable to the PAs' programs and they all have pluses and minuses. Traditionally, net energy savings have been computed using a bottom-up approach that incorporates a range of techniques to estimate net energy savings for individual measures/end-uses, programs, or groups of programs. However, this bottom-up approach is likely not fully capturing all the net impacts because programs are large, interactive, and may extend more widely than just to program participants, making it difficult to isolate the effects of any one program using just a bottom-up approach.

In response, the cross-cutting evaluation team investigated the following four different methods of estimating net savings over the past three-year cycle in MA.

- Participant self-report net-to-gross studies use a bottom-up approach to estimate net energy savings for individual measures/end-uses, programs, or groups of programs. Specifically, these studies provide estimates of free-ridership and like spillover at the end use, program, and PA level through interviews with program participants and trade allies.
- Market Effects. Market Effects studies seek to find evidence of and measure spillover savings from program-induced changes in the structure of the market. Market effects measurement recognizes that programs can also drive non-participant savings through market effects that are not captured by program project measure tracking or participant NTG evaluation. Market effects are an important part of broader net-to-gross evaluation research that if identified, may lead to significant additional program savings.
- Code Compliance Support Initiative (CCSI). The code compliance evaluation seeks to find evidence of and measure net savings attributable to the CCSI for improving code compliance in MA through various avenues over the long term. Codes and standards create a confounding influence on top-down, participant NTG, and market effects as savings may also be driven by compliance to codes and standards that are due to the PAs efforts in improving compliance.
- Top-Down Modeling techniques use a holistic approach by estimating program impacts across all energy-efficiency programs in a given geographical region or service territory, rather than running separate studies for each program (or measure/end-use within a program). Top-down models attempt to measure changes in energy consumption over time that are attributable to programmatic interventions by the utilities. Top-down methods are capable of capturing the full program effect, including free-ridership, spillover, market effects, and snapback.

These four cross-cutting topic areas are interrelated. The Top-Down evaluation area describes the net effect of all the PA programs and efforts on changes in total utility consumption. However, the underlying drivers of these net savings are better understood by using other methods to estimate net savings. These include participant NTG surveys, estimation of market effects, and estimation of savings attributable to codes & standards support. Taken together, these four topic areas identify program-driven savings in programs and markets in areas that overlap and provide different explanations for the net savings.

Although distinct from energy and demand savings, the fifth cross cutting area investigated over the past three year cycle included studies on non-energy impacts. Non-energy impacts play an important role in PA programs. Non-energy impacts may be positive or negative, but understanding their role in customer decision making and how the programs may be driving or utilizing non-energy impacts has two aspects relevant to broad top-down, participant NTG, market effects, and code support. First, non-energy impacts can influence decision making and thus affect the net savings of programs. Second, non-energy impacts can have a significant impact on program cost-effectiveness as a portion of costs or benefits captured in the total resource cost test or societal cost test.

Key Net Savings Research Areas

As the PAs continue to conduct NTG studies over the next three-year program cycle, it will be important to continue to refine net savings methodologies and measurement to ensure that savings attributable to the programs are being fully recognized, as well as to provide program staff with actionable information they can use to refine and improve the effectiveness of their programs.

Given the current state of evolution in the PAs' program portfolios and NTG methods, methodological guidance, informed by research into current best practices, should be explored on the following issues.

- Identification of Best Practices for NTG Evaluation of New Program Types
- Definition of Evaluation Domains and Avoidance of Double Counting Savings
- Combining or Selecting among the Results of Alternate Methods for Estimating Net Savings for a Single Program

Key Market Effects Research Areas

Market effects evaluation may identify program-attributable savings that are not currently being captured by the evaluation teams and credited to the program. Efforts to establish market effects research are underway and will continue to expand during the 2016-2018 plan cycle. With success in the HVAC markets, additional markets may be considered in the 2016-2018 plan cycle, with the PAs and the various evaluation teams collaborating to identify and assess additional promising markets and technologies. The PAs plan to consider a variety of activities for the 2016-2018 plan cycle, including:

- Expanding Market Actor Panels to HVAC Contractors (and Distributors)
- Including Additional Technologies and Markets in Market Effect Evaluation Activities

Key Codes and Standards Research Areas

Codes and Standards Initiatives in Massachusetts have the potential to increase compliance with the energy code and/or enhance the stringency of the codes and standards, both of which could save energy and have the potential to drive an increasing level of savings relative to traditional new construction programs. It is important to evaluate Codes and Standards Initiatives, both because the potential savings are large, and because they prevent a lost opportunity—i.e., it is much more expensive and time-consuming to retrofit a building than to incorporate efficiency measures when it is first built. Also, some of those savings from Codes and Standards Initiatives may overlap with the savings estimated for other programs, necessitating the need to eliminate double counting. The

PAs have identified several strategic research areas for codes and standards evaluation efforts during the 2016-2018 plan cycle, including:

- Continue and Expand Ongoing CCSI Evaluation Activities
- In-depth Interviews with Market Actors
- Comparison of PA and Municipal Residential New Construction Markets
- Stretch Code Support Initiative Evaluation
- Standards Advocacy Evaluation

Key Top-Down Modeling Research Areas

Top-down models are econometric models used to measure the effect of energy efficiency programs on aggregate energy consumption, while accounting for the effects of fuel prices and other factors. The goal of this type of modeling is to isolate the effect of program activity from natural changes and other policy variables. Typically, these methods are applied separately for the Residential and Commercial-Industrial sectors. The analysis looks at the variation in consumption (e.g., per household or per employee) across time periods and across geographic units (e.g., service territories, towns, counties, or states). The consumption is modeled relative to some measure of program activity, along with non-program factors. Top-down methods, in principle, measure the full impact of a program portfolio, including free-ridership, spillover, market effects, combination effects across programs and years, and snapback. Many of these effects are difficult to measure accurately at the program-specific level.

The prior study was successful in laying the groundwork for on-going research by identifying the data requirements and key statistical issues for future research activities. Over the next three years, research efforts should focus on three key activities, with a possible fourth given co-funding outside of Massachusetts:

- Data Compilation
- Exploration of Key Econometric Concerns
- Model Refinement and Testing
- Partnering Opportunities to Expand the Models beyond Massachusetts

Key NEI Research Areas

Estimating NEIs provides utilities, regulators, and customers with valuable information when designing, promoting, implementing, and evaluating energy efficiency programs. In Massachusetts, PAs are allowed to use NEIs as a supplemental source of benefits in regulatory cost-effectiveness testing. Promoting the positive NEIs of a measure or mitigating negative ones can also be important in program design and implementation.

To date, the PAs have focused on select participant NEIs that can be quantified using relatively objective techniques. However, the existing NEI literature suggests that there may be substantial yet unmeasured participant and societal impacts. Many of these benefits are more abstract in nature and estimation techniques for them may be more subjective. Nevertheless, there is ample literature that suggests these impacts exist, may be substantial, and may be measurable.

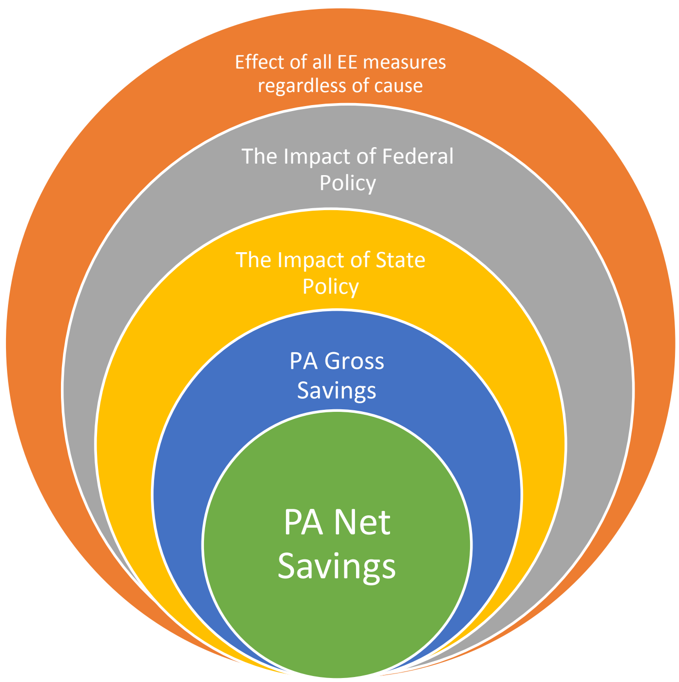
In the 2016-2018 plan cycle, the PAs will investigate several priority topics related to NEIs, including:

- Health and Productivity Impacts
- Market Rate Rental Properties
- Water and Non-utility Fuel Impacts
- Combination Engineering and Survey Based Estimation Approach

Potential Environmental Assessments

Stakeholders and PAs have requested an evaluation effort to better quantify all savings that are used in the calculations of greenhouse gas (GHG) emissions reductions that “are real, permanent, quantifiable, verifiable and enforceable" and should be counted that occur due to program efforts. The PAs can, to a large extent, reliably quantify how energy efficiency savings as reported under the GCA contribute to GHG reductions. There are concerns, however, that the limitations of reporting under the GCA may mean that their quantification does not account for all verifiable emissions savings. The Evaluation team has identified several layers of research, as shown visually in the figure below, that could be studied to determine their impacts on emissions[12]. These include, at increasing scale:

- PA net savings (currently calculated and reported)
- PA gross savings (total amount of energy savings regardless of attribution)
- PA gross savings plus the impact of additional Massachusetts public policy initiatives (e.g. GCA impact on consumer adoption of EE measures)
- The prior categories plus the addition of federal policy impacts (e.g. ARRA funding impact on weatherization programs)
- The effect of all EE measures on emissions without regard to cause (i.e. determining the total amount of the reduction in emissions without concern for for whether or not they were generated by PAs, state policies, federal policies or other causes). This may extend to impacts on the electric system beyond state borders).



The implication for PA research differs depending on the scale at which EE impacts would be analyzed. For example, a smaller gross savings analysis may look at the Gas Heating and Cooling program. While the PAs

[12] Note that the smaller circles are not meant to represent a subset of the larger circles (e.g., PA gross savings are not normally all captured under state or federal policies), but instead represent the typical magnitude of the expected impacts of the different sources of EE measures on emissions reductions. So note the figure is a simplification for illustrative purposes, and the actual relationships between the five levels are more complex than depicted.

quantify the incremental savings that result from incenting a natural gas customer to purchase a new high-efficiency furnace rather than a new standard-efficiency furnace, the PAs do not quantify the emissions reductions related to that customer transitioning from their old oil furnace to a new gas furnace. While those savings may or may not be attributable to EE efforts, the savings are not being counted in other areas and if they can be estimated can help better quantify the impact of the Massachusetts energy efficiency efforts on reduction of GHG emissions.

If a larger scale view is preferred, other research, such as investigating impacts from a top-down approach may be needed. In addition to the question of scale, there was discussion about the nature of the research and that research may need to extend beyond the traditional bounds of the utility system. Quantifying environmental benefits is a specific goal of the GCA and an important goal of the Commonwealth. Accordingly, the PAs will explore efforts through EM&V activities, with the support of the Council's independent EM&V experts and planning consultants, as well as DEP and DOER, to better quantify both the energy impacts used to determine climate and air quality benefits, and the estimates of other environmental benefits. This study could allow the Commonwealth to reassess the accounting of the GHG emission reductions attributable to energy efficiency. The PAs propose to complete this study before the filing of their 2019-2021 Plan.

5. STAGE 1 WORK PLANS

Through a collaborative process between the PAs and the EEAC consultants, the wide variety of topics that were developed during and following the Planning Summit were narrowed down and prioritized into a series of Stage 1 work plans. Those work plans are presented in this section and are organized by research area – Residential, Non-Residential, and Cross-Cutting. It should be noted that not every work plan presented in this section will be turned into a formal study that will be completed in the short term. Conversely, topic ideas that do not have a Stage 1 work plan at this point may actually go through the entire planning process and have formal studies completed in the near term. The point of this section is to illustrate those topic ideas that will most likely be studied in the near term but this is not meant to be an exhaustive list. Additionally, budgets, scopes, and research methodologies are all tentative until they are solidified in the later stages of study planning, and the staging of the listed studies is still under discussion.

5.1 RESIDENTIAL STAGE 1 WORK PLANS

Study Name: Residential Baseline Study (RES 1)
Research Area: Residential
Type of Study: Market Assessment
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

For this study, saturation and penetration data will be collected for all major appliances, mechanical equipment, and electronics in a home. These data will support energy savings calculations for program evaluation and design, as well as provide additional insight on the savings potential in the existing residential homes market. Depending on stratification, a sample size to of 300 to 400 homes will most likely be appropriate.

In designing this study, there are a several options to consider:

- Sampling from the general Massachusetts residential population;
- Targeting specific residential sub-sectors (single-family, multifamily, or manufactured homes).

An additional activity (with a relatively low incremental cost) would be to join in a multi-jurisdictional study to explore using nonintrusive load metering (NILM) to collect data for whole premise electric loads. These data would then be disaggregated into appliance-level loads. This NILM meter could be quickly and easily installed on the outside of a home's existing meter to capture minute and sub-minute electricity consumption where AMI house-level data are not available.

High-Level Description of Approach/Methodology:

Task 1: Develop Sample Design:

Determine study sample frame (i.e., single-family, multifamily, manufactured homes, or combination).

Task 2: Recruit Customers:

Customers will be recruited utilizing the telephone, mail, and the internet. A brief survey of demographic and home characteristics will be administered, to ensure sample quotas are met.

Task 3: Conduct Site Visit and Install Meters:

Site visits will take to capture information on key house characteristics, such as building frame, mechanical, lighting, appliances, and windows. During those visits technicians will install NILM meters on the revenue meter. For a sample of homes, meters will also be installed on electrical panels to develop a baseline for metered appliances for comparison to the disaggregated data to determine accuracy levels.

Task 4: Perform Meter and Data Analysis:

Analyze audit data gathered through all site visits, such as appliance and mechanical equipment, and develop penetration and saturation levels. Where applicable, compare these results to the previous building and appliance stock in Massachusetts for trends and changes. After approximately six months, analyze the whole-house meter data and develop specific appliance and mechanical load profiles.

Task 5: Reporting:

Present results to interested stakeholders. Develop a report outlining the sampling methods, audit collection protocols, and baseline results.

Value Proposition:

Baseline studies are important to conduct periodically to measure changes in customer appliance and building characteristics. Data collected through this study will provide a wide range of benefits, including improved estimates of market characteristics, demonstrating trends in adoption and providing insight into consumption characteristics for specific residential segments. Additionally, benefits of including NILM in the baseline study are:

- Capturing measure-level load shapes that can be used to establish residential appliance load profiles and coincidence factors;
- Providing the Massachusetts Program Administrators (PAs) with a method to align energy-efficiency demand-reduction efforts with specific end uses to optimize carbon emission mitigation;
- Providing the basis for future low-cost metering studies for multiple measures simultaneously; and
- Standalone, or when coordinated with key home energy management studies (e.g., automation), allowing for an increased level of savings detail on individual technologies and a greater understanding of interactive effects.

Potential Budget: $550,000 - $650,000

Study Name: MA Consumer and Saturation Survey, Including Panel (RES 5)
Research Area: Residential
Type of Study: Market Characterization/Assessment
Applicable Fuel(s): Electric

Overall Study Goals:

The goals of this study are to update estimates of lighting saturation and assess consumers' knowledge of and interactions with the lighting market in Massachusetts. As an optional add-on, the Team could expand the on-site data collection for new visits and panelists to include data to support the *Residential Baseline Study* (RES 1).

This study will provide the PAs with updates on critical lighting market indicators, while increasing their understanding of the current and evolving state of the market, especially as related to the continued expansion of the LED market and full implementation of the incandescent phase-out component of EISA. This study will also provide the PAs with information applicable to program planning and implementation in the face of declining delta watts and measures lives.

Research Questions:

The research questions listed below will allow for the continued tracking of some prior critical market indicators, and for examining emerging issues related to changes in the lighting market brought about by technological change and increased efficiency standards. Because practical issues such as budget, timeline, and respondent fatigue (i.e., surveys and on-site visits could become too long) may limit the number and depth of topics the Team is able to explore, the Team will need clear guidance from the PAs and EEAC Consultants about which of these issues is most critical.

- Examine socket saturation, including the presence of linear fluorescents
- Determine (via a panel study) what types of bulbs consumers use to replace those that burn out or removed
- Estimate in-service rates (ISRs) over time to the extent allowed through examining bulbs installed, in-storage, and newly purchased during panel home visits
- Provide information on various savings parameters such as delta watts, early replacement, and take back
- Explore possible ways of assessing measure life (especially given the expected long-life of LEDs), hard-to-convert fixtures, and non-energy impacts (NEIs)
- Assess customer awareness, purchase, use, and storage of energy-efficient bulbs, and their connection to the Residential Lighting Program participants
- Understand consumer decision making regarding bulb purchases and uses (e.g., pricing, preferences for room type)

High-Level Description of Approach/Methodology:

Task 1: Administer Consumer Surveys and Recruit On-Site Participants:

For this task, the Team will continue tracking key lighting market indicators for CFLs and LEDs, and documenting consumer responses to EISA. During the consumer surveys, the Residential Evaluation Team will also recruit participants for the new on-site saturation visits. The Team anticipates using a pre-paid incentive and mixed mode delivery, similar to the last two survey waves.

Task 2a: Conduct On-Site Saturation Visits:

Through on-site visits at 150 newly identified homes, socket saturations will be measured by type, location, and style of bulb and fixture; estimate the number of efficient light bulbs in use and in storage will be catalogued; evidence of stockpiling incandescent bulbs will be documented; and any other factors affecting lighting purchase behaviors will be recorded.

Task 2b: Conduct On-Site Panel Visits:

Households will be revisited that previously took part in on-site visits to understand bulb purchase and replacement behavior. This will include 354 households, first visited in 2013 (89), 2014 (114), or 2015 (151). Of these possible households, approximately 270 panelists may be interested in continuing the study.

At panel study homes, the evaluators will continue to test for possible reactive effects on bulb purchase and replacement behavior and on participation in other PA programs.

Task 3: Reporting

Key patterns, findings, and recommendations across all the evaluation tasks described above will be summarized. These results will be incorporated into an overall annual report together with all other lighting evaluation tasks.

Value Proposition:

Since 2002, the PAs and EEAC Consultants have fielded consumer surveys with Massachusetts consumers almost annually (and sometimes semi-annually). While the content and population of interest for these surveys has varied, they have yielded the longest, continuous time series of data on residential consumer use, awareness, understanding, and purchase of energy-efficient lighting in the nation.

For the 2015/2016 consumer survey effort, the Residential Evaluation Team will expand the existing series of data at a critical time in the lighting market, as the recently implemented—and looming new—efficiency standards limit the annual and lifetime savings per bulb, and LED sales and adoption continues to rise as prices fall. Informed program planning and implementation will require a careful assessment of trends in the lighting market that give the PAs and EEAC Consultants an understanding of how the market will respond to programmatic change, and perhaps most critically, if and when to exit the residential retail lighting market completely.

Potential Budget (Total):	$900,000 - $1,200,000
Base Study Budget:	$800,000 - $1,000,000
Incremental Budget:*	$100,000 - $200,000

* This incremental budget is for *Residential Baseline Study* (RES 1) data collection, with the data analysis and reporting costs included in that study's budget.

Study Name: New York Saturation Comparison Study, Including Panel (RES 6)
Research Area: Residential
Type of Study: Market Characterization/Assessment
Applicable Fuel(s): Electric

Overall Study Goal:

The goal of this study is to continue assessing lighting market trends in Upstate New York to understand how the market has responded to the ongoing absence of incentives from NYSERDA for all residential light bulbs (CFLs and LEDs, standard and spiral).NYSERDA ceased offering standard CFL incentives in 2012, and stopped all support for specialty CFLs and LEDs in December 2014, so New York serves as an optimal comparison area for Massachusetts to understand the "counterfactual" of what Massachusetts lighting sales might look like in absence of program support. The Team performed telephone surveys and on-site visits in 2014, which revealed critical differences in the rates of lighting market changes between Upstate New York and Massachusetts from 2013 to 2015. The Massachusetts market exhibited statistically higher rates of efficient bulb saturation for both CFLs and LEDS in 2015 compared to 2013, while the total efficient bulb saturation in Upstate New York remained relatively static (with CFL saturation dropping and LED saturation increasing from 1% to 3%).

Given the demographic similarity between the two states and the timing of NYSERDA's cessation of incentives, this study will provide continued and important insights into the impact of the Massachusetts program post-EISA. On-site visits in New York require substantial budget, and NYSERDA and the electric utilities in the state have not been willing to co-sponsor the research. Therefore, the Team offers two options for the timing of this task, and discusses the possibility of performing a panel study (which will also affect the choice of timing).

Research Questions:

With this study, the Team seeks to:

- Continue tracking consumer purchases of efficient light bulbs in the absence of program incentives;
- Compare consumer purchase and saturation trends between Massachusetts and New York to determine if they continue to diverge; and, if so,
- Determine whether the lack of NYSERDA incentives contributes to these divergences in efficient bulb socket saturation and household penetration between New York and Massachusetts.

High-Level Description of Approach/Methodology:

Task 1: Finalize Work Plan:

Feedback from the PAs and EEAC Consultants is needed on two issues:

1. **Timing of the data collection:** The data collection and analysis for any lighting on-site saturation studies is expensive—and these expenses are typically higher in comparison areas because potential participants have no direct investment in the outcome of the study (i.e., they are not Massachusetts residents). The expense—and the fact that the last New York study also occurred at a two year interval—suggests planning for field collection in late 2016 and early 2017. However, with rapid changes in the lighting market and the possibility that either NYSERDA or the electric utilities in the state could choose to offer lighting incentives again, it may be better to collect data in New York in late 2015 and early 2016, coincident with the planned timing for Massachusetts field collection.
2. **Potential panel study:** The PAs and EEAC Consultants have expressed a high level of satisfaction with the Massachusetts lighting panel study and related insights gained. In fact, the Residential Baseline Study (RES

1) panel includes the potential for expansion to include other products. This task could include a panel in New York: the Team prepared homes visited in 2015 for a panel study by marking bulbs installed and in storage and following a set of protocols meant to facilitate return visits.

The Residential Evaluation Team would also need to recruit new homes to replace those who decide not to let us revisit their home or are otherwise unavailable. The sample of new homes will also allow us to test for any reactive effects of being a study participant.

Panel studies work best with annual visits, which limits drop-outs and possible study contamination. The panel will require regular—and somewhat substantial—investments in on-site visits in both New York and Massachusetts. Therefore, while there is value in tracking bulb replacement behavior and saturation in the same homes over time in both states (despite whether the New York electric utilities or NYSERDA restart incentives), it may not be cost-effective.

Task 2: Conduct Recruitment Surveys:

The Team will conduct short (seven to 10 minute) random digit dial telephone surveys with residents of select areas of Upstate New York and Westchester County (n=400), based on a sample of landline and cell phone numbers. The Team will work with the PAs and EEAC Consultants to seek permission from the electric utilities and NYSERDA to mention their names during recruitment and to provide their call centers with information about the study in case customers call with questions.

Task 3: Perform On-Site Saturation Inventories:

The Residential Evaluation Team will conduct detailed on-site lighting inventories (n=150) in portions of Upstate New York and Westchester County. We anticipate that 65 of the 150 visits will be revisits, and 85 will be new visits. We recommend 150 visits because the 2015 sample of 101 households was inadequate to determine a ±10% statistically significant difference in CFL saturation between New York and Massachusetts. However, a sample of 125 homes would have yielded significant results; and 150 visits will provide greater statistical power in order to ensure the accuracy of results.

The Team will compare the results to those obtained in earlier lighting studies in New York and Massachusetts, continuing to track trends in the saturation, use, storage, and purchase of energy-efficient bulbs. If the PAs and EEAC Consultants decide to have the Team conduct a panel study, the Team will mark bulbs and collect the necessary information to identify bulb replacement behavior during future visits.

Task 4: Reporting:

The Team will summarize the New York and Massachusetts results from the same time period (2015/2016, 2016/2017, or both) in a high-level memorandum. We will then incorporate these results into the overall annual report that addresses all lighting evaluation tasks.

Value Proposition:

By understanding consumer reactions to the removal of incentives for CFLs and LEDs in New York, the PAs and EEAC Consultants would have critical information to help with program planning in the face of declining delta watts and measure lives stemming from the adoption of lower-wattage bulb types and EISA regulations. These data will inform decision of whether to continue CFL and/or LED incentives, for how long, and in what retail channels, which is critical to cost-effective program planning and implementation.

This study presents a rare opportunity for the PAs and EEAC Consultants to determine what might happen in Massachusetts under a "no program" scenario based on a similar comparison area. While the study is expensive, the value is clear, with the greatest value gained by performing New York data collection coincident with Massachusetts data collection (in late 2015 or early 2016) and by convening a panel study in New York.

Suggested Timeline:

The work to develop a panel in New York would begin in the fall of 2015, with recruitment surveys fielded no later than November 2015 and on-site visits beginning no later than December 2015.

If the PAs and EEAC Consultants select to have no panel conducted, the recruitment surveys and on-site visits can be performed in late 2015/early 2016 or late 2016/early 2017.

Potential Budget: $355,000 - $430,000

Study Name: Lighting Supplier Interviews and Surveys (RES 7)
Research Area: Residential
Type of Study: Market Characterization/Assessment
Applicable Fuel(s): Electric

Overall Study Goal:

The Massachusetts PAs and EEAC Consultants have historically relied on supplier interviews with manufacturers, high-level buyers, and store managers to provide insights into the residential lighting market and the Massachusetts program, processes, and impacts. This study would build on past supplier interview feedback by tracking critical long-term market and program indicators, while also determining suppliers' assessments of the degree of market effect from the Massachusetts program (in terms of causing long-term, lasting changes to the structure and function of the lighting market).

Research Questions:

With this study, the Team seeks to gain suppliers' perspectives of these:

- Price and market share trends of various bulb types through 2020;
- Impact of the program on CFL and LED sales (including interim determinations of NTG, if desired);
- Degree of market effect from the Massachusetts program and its impact on the regional and national markets; and
- Effects of any specific design changes to the Massachusetts upstream lighting programs (such as the phase-out of specialty CFL rebates, reductions in the LED discounts, and a greater emphasis on hard-to-reach retail channels).

High-Level Description of Approach/Methodology:

Task 1: Identify Sample and Develop Sample Design:

Working with the PAs and their implementation contractor, the Team will gain access to recent program tracking data. We will use these data to identify the population of manufacturers, high-level buyers, and retail store managers who took part in the program through the fall of 2015, as well as to sales weight their price predictions and the NTG estimate.

For the Computer Automated Telephone Interview (CATI) survey of participating retail store managers, the Residential Evaluation Team will design a stratified sample to ensure adequate representation of all retail channel and bulb types. For Task 3 below, the Team will attempt to complete in-depth interviews with the full population of participating lighting manufacturers and high-level retail buyers.

Task 2: Develop In-Depth Store-Manager Interview:

The Team will work with the PAs and EEAC Consultants to prioritize interview and survey topics for store managers, paying attention to both the appeal of stakeholder input and the value of that input to understanding program processes and impacts, and to informing program planning, design, and implementation.

Task 3: Interview Manufacturers, High-Level Buyers, and Retail Store Managers:

The Team will conduct 25 in-depth interviews with participating manufacturers and high-level buyers (attempting to interview the full population of these program partners if possible). We will combine the results with the results from Task 4 in a memorandum, which will be integrated into the overall annual lighting report with results from all lighting-related studies.

Task 4: Survey Retail Store Managers:

The Team will perform 225 CATI interviews with retail store managers, or those most knowledgeable about lighting ordering, shelf-stocking, and purchasing patterns. We will combine the results with the results from Task 3 in a memorandum, which will be integrated into the overall annual lighting report with results from all lighting-related studies.

Value Proposition:

Over the past few years, supplier interviews have provided the PAs and EEAC Consultants with supplier perspectives on the current and emerging Massachusetts and national lighting markets, as well as with critical indicators of the importance of the Massachusetts program on the promotion of energy-efficient lighting. The PAs are likely ready to deprioritize some of the topics previously explored (such as partner program satisfaction, which has been consistently high), while other topics could be better addressed through a different evaluation design (e.g., the adequacy of the hard-to-reach definition). The Residential Evaluation Team will work with the PAs and EEAC Consultants to ensure that the Team focuses the 2016 interview questions on those of critical importance to program evaluation, planning, and implementation.

Suggested Timeline:

The Team would develop in-depth interview guides for manufacturers, high-level buyers, and retail store managers in the late fall of 2015 and conduct interviews in early 2016. We would develop the store manager interview guide in early 2016 and conduct interviews in the spring of 2016. We anticipate delivering the summary memo in the late spring or early summer of 2016.

Potential Budget: $175,000 - $240,000

Study Name: Market Adoption Model Update (RES 8)
Research Area: Residential
Type of Study: Market Characterization/Assessment
Applicable Fuel(s): Electric

Overall Study Goal:

This study will result in an updated market adoption model (MAM) with the most current lighting data available in order to illustrate the current and emerging status of the Massachusetts lighting market and to establish a delta watts estimate for general service CFL and LED residential lighting.

The residential lighting market is transitioning rapidly, which is accelerated by the federal phase out of most incandescent bulbs. EISA legislation has promoted the adoption of LEDs and encouraged a decrease in incandescent market share, as intended, but has also encouraged the adoption of inefficient halogens and decreased the market share of CFLs. By updating the MAM with the most current lighting data—from saturation surveys, supplier interviews, and lighting panel data—it will reveal how consumers are currently reacting to EISA, and allow the Team to estimate the rate of consumer adoption of various bulbs types through 2023.

A further goal of updating the MAM is to display the data graphically and provide corresponding explanations for stakeholders who may not use the spreadsheet-based tool but are interested in the model inputs, outputs, and uses.

Research Questions:

For this study, the 2015 MAM will be updated in order to produce a timely representation of the rapidly changing residential lighting market in Massachusetts and estimate current delta watts while predicting delta watts out through 2023.

High-Level Description of Approach/Methodology:

Task 1: Update the 2015 MAM:

The MAM will be updated with the most current Massachusetts lighting data on socket saturation data, bulb replacement behavior, and supplier forecasts for market share. This will make the MAM residential lighting scenario reflect the latest information of what bulbs are actually in Massachusetts consumer homes, and enable the Team to use the MAM to best assess the direction of the lighting market for the next few years.

The MAM will also include updated predicted values (which are currently in years 2016–2023) to reflect the most likely consumer lighting adoption scenarios, then will generate delta watts for every year of the prediction period. The budget below assumes updates only to the existing MAM inputs or other minor items. More substantial edits, such as to the contents or factors considered, will require additional budget.

Task 2: Reporting:

The MAM is not well understood by users who have not worked directly or extensively with the tool. Accessible graphics and explanatory materials will be developed that communicate what inputs the model uses and what outputs the model produces, as well as how to appropriately interpret and use these outputs.

The model and corresponding graphics and explanatory materials will be presented to the PA and EEAC Consultants. The budget below includes material development, assuming typical stakeholder comments and revisions, as well as one or two presentations. Additional budget would be required for substantial revisions to the explanatory graphics and/or materials, and for extensive or numerous presentations.

Value Proposition:

By understanding the residential lighting market and consumer reactions to EISA, the Massachusetts PAs and EEAC Consultants would have critical information to help with program planning, including estimates of current and future delta watts based on actual Massachusetts lighting data and accounting for the adoption of lower-wattage bulb types due to EISA regulations. These data will inform decisions of whether to continue CFL and LED incentives, and for how long, and will allow the PAs and EEAC Consultants to plan proactively by continuing to predict consumers' lighting purchases through 2023.

Suggested Timeline:

The Team would update the 2016 report MAM in the late spring and early summer of 2016, after completing supplier interviews and surveys. A timeline for updating the 2016 to 2018 planning MAM will be determined collaboratively with the PAs and EEAC Consultants regarding their needs for the revised planning model.

Potential Budget: $35,000 - $55,000

Study name: Lighting Decision Making (RES 48)
Research Area: Residential
Type of Study: Market Assessment
Applicable Fuel(s): Electric

Overall Study Goal:

The goal of this study is to conduct market research to help PAs understand how customers make purchasing decisions related to lighting and how that knowledge could be applied to improve in-store marketing and improve program performance.

Close coordination with implementation staff and vendors will be needed to understand current marketing efforts and perceptions of strengths and weaknesses. In addition, the Team will contact key retail allies to solicit feedback and suggestions for improving current in-store marketing efforts. The Team will then lead focus groups with consumers. Based on the results of previous tasks, the Team will partner with one or more retailers to conduct a revealed preference analysis of an actual retail environment.

Research Questions:

What factors influence consumer lighting purchase decisions? How well does current program marketing align with consumer purchasing decisions? How could marketing materials and efforts be improved to increase program performance?

High-Level Description of Approach/Methodology:

Task 1: Stakeholder Interviews:

Draft and conduct in-depth interviews with implementation staff, contractors, and key retail partners. Interviews will focus on understanding the customer decision-making process and current marketing activities to learn perceived strengths, weaknesses, effectiveness, and any opportunities for improvement. During interviews, the Team will also attempt to identify any prior market research available from key stakeholders.

Task 2: Consumer Focus Groups:

Based on feedback from stakeholder interviews, the Team will design and lead focus groups with consumers to explore their understanding of lighting products, to what extent they value various lighting elements, and how much attention they pay to various marketing messages. The Team anticipates working closely with program implementation staff to develop and refine the focus group design and anticipates inviting evaluation and implementation staff to observe the focus groups. The Team also intends to give focus group participants lighting products and in-store marketing materials and solicit their feedback and reactions.

Task 3: Optional Retail Revealed Preference Study:

Based on the stakeholder interviews and focus groups and depending on whether the outcomes appear promising, the Team will design and execute a retail-based study, testing various marketing messages and delivery mechanisms in an actual retail environment. To successfully execute such a study, the Team will need to identify one or more retail partners willing to allow their customers to participate in the study.

Initially, the Team believes that a pop-up retailer may offer the best scenario as this will allow for high traffic and a greater number of participants. However, studying customer responses to scenarios in traditional stores may also be desirable. Designing the study will require close cooperation with PAs and implementation contractors to develop alternative messages and delivery mechanisms. The cost for this task is high and cost estimates are imprecise and may need to be revised in discussions with the PAs.

Value Proposition:

Over the past few years, bulb purchasing has become increasingly more complicated for consumers. Terms like lumens, color temperature, and color rendering are confusing and frustrating. The strategies and approaches consumers have and will develop for choosing among bulb alternatives are unknown and may not entirely align with what they have used in the past or assumed by the lighting industry. This research will help the PAs understand what factors influence consumer choice and what tradeoffs consumers make. A better understanding customer decision-making processes and influences will help the PAs design more effective program materials that may result in increased program performance. Note that the Team lists the Revealed Preference Study as an option because the cost for this task is triple that of the other tasks and the estimate is soft as it may change based on final scope.

Potential Budget:	**Tasks 1 – 2:**	$80,000 - $100.000
	Task 3:	$150,000 - $300,000

Study Name: Appliance Recycling Research (RES 11)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Electric

Overall Study Goal:

The primary goal of this study is to update the current Appliance Program per-unit gross energy savings and net-to-gross estimates to inform both annual reporting and the 2016–2018 implementation plan. A secondary goal is to apply appliance recycling-specific evaluation methodologies that have been identified as industry best practice since the previous evaluation.[13]

Research Questions:

With this study, the Residential Evaluation Team seeks to answer the following research questions:

- What is the current per-unit program gross savings?
- What percentage of the program units were manufactured after the U.S. Department of Energy (DOE) published its first national conservation standard in 1990? What was the effect of subsequent DOE standards in 1993 and 2001?
- Is the current per-unit gross savings likely to change over the 2016–2018 cycle as the mix of post-standard recycled appliances changes?
- What would have happened to participants' refrigerators and freezers had they not recycled them through the program?
- How does the program interact with the Commonwealth of Massachusetts and the regional secondary appliance market, and how do these interactions impact net savings?
- Do gross or net savings differ in any meaningful way across PAs, regions, customer segments, or program delivery channels (if applicable)?

High-Level Description of Approach/Methodology:

Task 1: Convene Kick-Off Meeting:

Following the PAs' and EEAC Consultants' approval of a work plan, a kick-off meeting with study stakeholders will be scheduled to refine research objectives, review the proposed methodology, establish the most relevant secondary metering data to use, and finalize the study timeline.

Task 2: Review Tracking Data:

Following the kick-off meeting, all program data collected since the previous evaluation will be reviewed to ensure that all the data necessary to accurately complete an evaluation is collected. Specifically, complete information

---

[13] National Renewable Energy Laboratory. *The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures.* Chapter 7: Refrigerator Recycling Evaluation Protocol. NREL/SR-7A30-53827. Prepared by Cadmus. April 2013. Available online: http://www1.eere.energy.gov/wip/pdfs/53827-7.pdf

regarding key appliance characteristics, such as age, size, and configuration, as well as critical customer contact data (name, phone number, and participation date) is needed. The evaluators will work closely with the PAs and program implementer to resolve any issues identified.

Task 3: Survey Participants and Nonparticipants:

To understand what likely would have happened to the recycled appliances in absence of the program, the Team will survey a sample of recent program participants and of nonparticipants (customers who discarded an operable, program-eligible refrigerator or freezer outside of the program). Because surveyed participants often exhibit socially responsible response bias, the Team can assess the reliability of their hypothetical responses by collecting information from nonparticipants regarding how they actually discarded their operable appliance outside the program. Collectively, these surveys will enable the Residential Evaluation Team to determine the percentage of appliances that would have remained active without program intervention (in a participant home or another Massachusetts home).

The Team will determine the sample sizes and potential stratification schemes as part of the planning process. The budget below is based on 500 participant surveys and 100 nonparticipant surveys.

Task 4: Interview Market Actors:

To understand the eventual fate of older appliances, absent the program, that are picked up by retailers when delivering replacement units, as well as those collected by haulers, the Team will interview a sample of local market actors. The information from these interviews and from the participant and nonparticipant surveys will enable the Team to determine the program net-to-gross ratio.

The sample sizes and potential stratification schemes will be determined as part of the planning process. The budget below reflects 50 interviews.

Task 5: Analyze Impacts:

An analysis of gross and net savings impacts will be completed. To estimate average per-unit gross savings, the evaluators will combine detailed program database information regarding key appliance characteristics with regression model outputs (developed using data from previous appliance recycling metering studies in other jurisdictions) that relate appliance characteristics to observed energy consumption. This cost-effective approach leverages existing metering data to produce a Massachusetts-specific savings value.

During the kick-off meeting, the evaluators in collaboration with the PAs and EEAC Consultants will determine the most appropriate metering studies to use. Options include studies from California, Michigan, Wisconsin, and New York. Although New York data (collected as part of a National Grid study) are the most regionally appropriate, adding other state data would improve the explanatory power of the model.

To estimate net savings, the approach detailed in the Uniform Methods Project will be followed to combine information from participants, nonparticipants, and market actors, and to account for factors such as secondary market impacts and induced replacement.

Value Proposition:

Appliance characteristics change over time as recycling programs mature, as do primary versus secondary usage behaviors. The Uniform Methods Projects recommends updating gross and net savings every two years for mature appliance recycling programs to capture these changes over time. Additionally, updating the metering database with data collected in New York will improve the annual consumption estimates with recent, regional data.

Potential Budget: $121,000 - $183,000

Study name: Oil Early Replacement Market Characterization (RES 15)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Electric

Overall Study Goal:

As part of the 2015 High Efficiency Heating Equipment Impact Evaluation, the study investigated the performance of baseline heating equipment, but did not attempt to quantify the typical rated efficiency mid of early retirement units. For this study, a combination of field visits and heating contractor surveys will be used to assess the average early retirement baseline for oil equipment, and then current savings estimates will be revised.

Research Questions:

This study will enable PAs to determine the average rated and in-situ efficiency of oil furnaces and boilers replaced by gas heating equipment, as well as assess which specific customer markets the PAs should target to maximize potential program savings.

High-Level Description of Approach/Methodology:

Task 1: Develop Contractor Survey Instrument

Coordinate with the Heating Contractor Survey task to integrate contractor survey questions and recruit contractors to participate in this study. Contractors will be asked about the typical age, condition, and estimated efficiency levels of replaced oil furnaces and boilers, and be recruited to participate in field training.

Task 2: Design Field Data Collection Approach

Further refine field data collection recruiting approach (in conjunction with Task 1) through discussions with PAs. The Team will also design field data collection forms and conduct field staff training. The field visits may be conducted by the participating HEHE contractor.

Task 3: Collect Field Data

Conduct site visits to collect information on oil equipment age, condition, maintenance history, actual operating efficiency, and conduct spot measurements.

Task 4: Analyze Data

Conduct any specific, additional analyses of survey data beyond that reported. The Team will integrate the relevant survey results and field data from this study, focusing on estimating the average rated and actual efficiencies of oil furnaces and boilers.

Task 5: Reporting

Report findings to PAs through an initial results presentation, followed by draft and final reports, and a final presentation.

Potential Budget: $160,000 - $200,000

Study Name: Gas Condensing Heating Equipment Barriers Research (RES 16)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Gas

Overall Study Goal:

The 2015 *High Efficiency Heating Equipment (HEHE) Impact Evaluation* showed that condensing boilers are not achieving maximum energy savings, in part due to installation practices and controls configuration. Specifically, the study indicated that the use of more energy savings-optimized outdoor reset controls in combination with better thermostat settings and customer education could increase realized savings.

This follow-on study is designed to field test the proposed solution, and will include reanalyzing existing data from the HEHE impact study, additional field data collection and metering, surveys, and field work to:

- Measure the savings associated with specific improvements to condensing boiler installations
- Estimate the costs associated with specific improvements to condensing boiler installations
- Determine the incidence of specific correctable boiler installation issues
- Explore possible program mechanisms to incent greater adoption of these practices
- Understand other barriers to adoption and quality installation of condensing equipment, including water heaters.

Throughout this plan, the evaluation team refers to two types of installation improvements: Controls-only solutions and higher-cost solutions:

- Controls-only solutions
    - Implementing more energy savings-optimized outdoor reset control settings
    - Reducing thermostat setbacks
    - Educating homeowners on what to expect from their boiler
- Higher-cost solutions
    - Increasing distribution in high-load zones
    - Reducing loads by improving insulation and/or air sealing in high-load zones

The team proposes focusing field work on controls-only solutions as the lowest-cost option, while conducting research on costs and other barriers associated with higher-cost solutions through contractor interviews.

Research Questions:

The study will seek to answer these questions:

- What are the specific actions that contractors need to take in order to use more energy savings-optimized outdoor reset controls during condensing boiler installations?
- Do customers need to use different thermostats and thermostat settings in order to maintain expected comfort while using more energy savings-optimized outdoor reset controls?
- What are the costs associated with taking these actions?
- What are the savings associated with controls-only solutions?
    - Can smaller setbacks improve comfort and performance when combined with more energy savings-optimized outdoor reset controls?
    - How often can a simple, controls-only solution make a significant impact on savings?
- How often do customer comfort complaints arise from using a more energy savings-optimized outdoor reset?
- What is the prevalence of higher-cost barriers (not enough baseboard length, not enough boiler capacity) that limit the implementation of energy savings-optimized outdoor reset?
- What are current best practices around implementing energy savings-optimized outdoor reset and how often do contractors currently use these practices? What training and financial support would contractors need to implement these practices more often?

High-Level Description of Approach/Methodology:

Task 1: Reanalyze existing data from HEHE impact study:

The team will assess the data collected during the earlier HEHE Impact Evaluation to determine what additional data will need to be collected onsite to determine what actions need to be taken at each site to use a more energy savings-optimized outdoor reset control. To the extent possible, we will reanalyze the existing data to determine how aggressive an outdoor reset could be implemented at *each* site with the existing emitters and different setbacks, in effect predicting whether a controls-only solution is feasible for *each* site or whether higher-cost solutions would be required. The team will develop a list of required data to provide a controls-only prescription for each site.

Task 2: Design Field Data Collection Approach:

Based on the results of Task 1, we will design field data collection forms and analysis tools to capture required data and update controls prescriptions for each site. This will include piloting data collection and analysis tools before starting field data collection. The field data collection design will include scripts or protocols for the following components:

- **Recruiting**. The recruitment script will be designed to make further participation in this next phase of condensing boiler research attractive to the approximately 60 participants from the 2015 study with usable data. In addition to participation incentives, the script will be personalized as much as possible with Task 1 findings such that potential energy savings and comfort benefits can be articulated to customers at the time of recruitment.
- **Site Visit to Ascertain Solution Viability, Implement Solution, Meter Equipment, and Survey Customer.** This first site visit will determine whether the customer is a good candidate for controls-only operational improvements. Where that is the case, the controls-only strategy will be implemented, along with the necessary metering and monitoring equipment necessary to estimate saving Improvements from improved supply and return water temperatures.
- **Metering Equipment Removal Site Visit**. During this second site visit we will collect all removable study equipment, and conduct a brief customer satisfaction / engagement survey.

Task 3: Field Data Collection:

The team will recruit previously-metered sites for participation in this study. As shown in Figure 1, we will conduct initial site visits for a sample of 50 previous participants, and ultimately correct and meter 25 of those that can be most easily corrected.

Initial Site Visit (50): The primary objective of the initial site visit is to identify necessary controls and other solutions onsite. This will include collecting the following information at the initial site visit:

- Zone-level housing envelope details

Heat emitter (baseboard) characteristics (including length, etc.)

- Thermostat schedules and homeowner occupancy and usage characteristics

The team will determine during the initial site visit whether or not each home and condensing boiler represents a good candidate for controls-only operation improvements (easy correction sites) or controls and emitter or envelope improvements (difficult correction sites). In addition, all sites will receive a short customer satisfaction survey.

Metering Easy Correction Sites (25): The team will plan on implementing controls solutions at all of the customers that have a controls-only correction available, up to 25 sites. As part of the initial site visit, we will implement the controls changes and install home metering equipment to monitor the return water temperature and thermostat.

We recommend installing wireless communicating thermostats that allow ramping operation to implement "soft starts" when returning from setbacks.[14] The data from these thermostats may also provide an important customer engagement tool by providing an "early warning" about heating problems in the home. We intend to leave meters in for 2-3 months, spanning a range of outdoor temperatures. Customers complaining about comfort or heating quality will be given the option to either get their controls adjusted or drop from the study.

Cost Estimates for Difficult Correction Sites (Up to 25): For sites that cannot be corrected via controls alone, the team will develop a list of work options to achieve the required outdoor reset (zone-level emitter or envelope improvements) and get estimates from contractors to perform the work. We will not have the work performed or meter these sites at this time.

Task 4: Field Data Analysis:

The evaluators will analyze the metered data to determine the new efficiency curves for each site as a function of outdoor temperature and load. We will compare the post-controls optimization efficiency curves to the curves derived from metering during winter 2013-2014 and estimate percentage improvement in performance. Additionally, we will summarize customer satisfaction issues captured in the onsite surveys.

Task 5: Develop Contractor and Plumber Survey Guides:

In parallel with the field study, the team will develop a survey to determine typical practices and barriers to improved installation practices. We anticipate that the participating contractors will include heating equipment contractors and plumbers who install hydronic heating and water heating equipment. Through the contractor survey, we will assess:

- Condensing boiler installation practices, in particular controls
- Condensing water heater installation practices
- Barriers to installation of condensing equipment
- Barriers to improved controls commissioning for condensing equipment

As part of this work, the team will conduct in-depth interviews with five market experts[15]/leading contractors to identify key best practices and market barriers to ask about.

Task 6: Conduct Contractor and Plumber Surveys:

The team will conduct surveys with 30 contractors and plumbers who install condensing heating and water heating equipment. The survey will stratify the contractor sample according to how many pieces of condensing equipment they installed through the HEHE program in recent years and talk to 10 of the largest, 10 medium-sized, and 10 small contractors.

Task 7: Survey Analysis:

---

[14] We would like to discuss this point further, including who would install the wireless thermostat. We are considering including a contractor at each of the initial site visits.

[15] Market experts include manufacturers, distributors, and boiler technician trainers.

This analysis will focus on assessing current installation practices, barriers to improvements and possible program solutions. We will identify the most important barriers to implementing better condensing boiler controls. We will reach out to PA implementation teams to discuss possible solution development, as needed.

Task 8: Cost Analysis:

This analysis will draw on findings from the controls-only field portion of the study and contractor and plumber surveys to estimate costs for controls-only and higher-cost solutions for condensing boiler installation.

Task 9: Reporting:

Findings will be reported to the PAs and EEAC Consultants through initial results presentation, draft and final reports, and final presentation.

Potential Budget: $280,000 - $465,000

Study Name: Impact Study of Heat Pump Water Heaters (RES 20)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Electric

Overall Study Goal:

The goal of this study is to conduct research to quantify savings associated with heat pump water heaters (HPWH).

This evaluation will determine the savings associated with heat pump water heaters in retrofit and new construction applications and quantify the impact of different installation practices.

Research Questions:

- What are the savings associated with heat pump water heaters in Massachusetts in retrofit and new construction applications? What is the appropriate baseline in retrofit applications?
- How do savings vary based on heating, cooling, and dehumidification equipment type, heat pump water heater installation location, and home type? What are the secondary energy impacts on heating, cooling, and dehumidification?
- What is the value of dehumidification and other comfort impacts of the equipment?

High-Level Description of Approach/Methodology:

<u>Task 1: Review of existing deemed savings assumptions and participating equipment performance characteristics:</u>

Review the current assumptions used to estimate savings. Review existing data being collected and assess the factors that should drive variations in savings associated with the equipment being installed through the program.

<u>Task 2: Finalize Work Plan and Data Collection Tools</u>:

Based on the results of Task 1, develop an improved data collection methodology that will capture data on the drivers of savings.

<u>Task 3: Participating Customer Survey</u>:

Conduct online surveys to fill gaps in savings drivers, including HVAC equipment usage patterns, type of previous equipment, and whether it was in good working order or replaced upon failure, equipment installation location, household demographics, and equipment impact on customer comfort.

<u>Task 4: Participant billing analysis on retrofit projects</u>:

Conduct billing analysis on participants, using customer survey data as additional explanatory variables. Use results of billing analysis to quantify total net energy impacts. Use explanatory data from billing analysis to extrapolate to new construction baseline case.

<u>Task 5: Estimate non-energy impacts of dehumidification</u>:

Estimate dehumidification delivered based on best available manufacturer performance data. Based on NEI research from RES 27, estimate the NEIs associated with improved humidity in the occupied and unoccupied space.

These should include comfort impacts and health impacts associated with maintaining lower humidity in the space and accompanying reduction in dust mite prevalence.

Optional Task 6: Conduct Detailed Pre-Post Metering of Equipment:

Work with contractors to install metering equipment before installation of the equipment to assess energy usage and humidity impacts of the equipment. This will include energy metering of the HPWH and humidity metering in the space containing the HPWH as well as the occupied spaces of the home. Metering will include at least eight weeks pre-installation and six months post-installation. These data will then be incorporated within additional billing analysis to extrapolate to the overall population.

Potential Budget: $125,000 - $200,000 (+$150,000 - $300,000 for pre-post metering and humidity impact assessment)

Study Name: Heating Contractor Survey (RES 25)
Research Area: Residential
Type of Study: Process and Impact Evaluation
Applicable Fuel(s): Gas

Overall Study Goal:

At least two other studies *Oil Early Replacement Market Characterization* and *Gas Condensing Heat Equipment Barriers Research* would rely on collecting information from heating contractors. The goals of these heating contractor surveys and the market research study are to:

- Avoid duplication and gain synergies across these research efforts
- Provide a standalone report describing overall heating contractor satisfaction, such as program elements that work well and those that can be improved

Research Questions:

The details of research question that will be addressed through heating contractor surveys are outlined in the *Oil Early Replacement Market Characterization* and *Gas Condensing Heat Equipment Barriers Research* summaries.

High-Level Description of Approach/Methodology:

Task 1: Define Contractor Tiers

Define the following three tiers for collecting information:

- Tier 1- This is the top 10 to 20 contractors in terms of participation volume, or could be the top 10% based on another indicator of interest to the PAs and EEAC Consultants.
- Tier 2- This middle tier of contractors have just over a handful of participant installations annually.
- Tier 3- This tier of contractors have just a handful of installations but are large enough to provide additional HEHE volume if they choose.

Task 2: Conduct Qualitative Research

This task would involve detailed open-ended interviews with tier 2 contractors and focus groups with tier 2 and tier 3 contractors to ask general program questions and to test the survey questions to ensure the Team receives appropriate responses to aid in analysis.

Draft and final interview guides will be prepared for PA and EEAC Consultant review prior to implementing this task. A draft and final memorandum of qualitative research findings will also be prepared.

Task 3: Design Contractor Survey

As stated previously, the survey will be designed in coordination with needs of other studies, based on the results of Task 2. The survey will focus on program satisfaction, participation drivers, and other additional questions as outlined in the other studies.

Task 4: Conduct Contractor Surveys

Survey contractors and plumbers who: (1) participate in oil to natural gas heating conversions, (2) install condensing heating and water heating equipment, and (3) other strata by tier level as desired by the PAs and EEAC Consultants.

Task 5: Analyze Data

Conduct analysis of the survey data and integrate qualitative and quantitative analyses into a cohesive narrative focusing on gas heating contractor satisfaction (e.g., elements of the program that work well, elements that can be improved).

Task 6: Reporting

Report findings to PAs and EEAC Consultants through an initial results presentation, followed by draft and final reports, and a final presentation (if needed).

Potential Budget: $100,000 - $200,000

Study Name: HVAC Non-Energy Impacts Assessment (RES 27)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to conduct research to quantify secondary fuel savings associated with heat pumps and other HVAC systems.

Non-electric, non-gas savings associated with HVAC systems installed through initiatives runs by the PAs will be assessed. Secondary fuel savings may be significant for HVAC equipment installed with a retrofit baseline.

Research Questions:

- What are the take-back impacts on non-electric, non-gas savings associated with ductless heat pumps?
- What are the non-electric, non-gas savings associated with other heat pumps?
- How much of those savings comprise oil, propane, kerosene, and wood?
- How efficient are the non-gas, non-electric equipment being displaced?

High-Level Description of Approach/Methodology:

Task 1: Assess likely secondary fuels and likely changes in consumption:

Review results of previous studies to determine which secondary fuels are present and which ones were asked about and determined to be negligible. Also examine the available data regarding changes in behavior associated with installation of new equipment. Examine current estimates of secondary fuel use.

Task 2: Finalize Work Plan and Data Collection Tools:

Based on the results of Task 1, develop an improved data collection methodology that will capture data on the drivers of behavioral change and available billing data.

Task 3: Participating Customer Survey:

Conduct online surveys with nested phone interviews. Use these surveys to improve estimates of the portion of participants with different secondary fuels and the portion of these participants who significantly changed their heating and cooling patterns. Allow customers to “opt in” to supplying additional information via phone interview and collection of billing/consumption data (e.g., how many gallons of oil did you use in winter of 2013–2014, winter of 2014–2015). The online survey will provide sample bias correction on the interview billing data results.

Task 4: Analyze billing data to estimate secondary heating adjustment factor for each stratum:

Conduct site-specific billing analysis on participants, utilizing customer survey data and usage data for additional data opt-in survey participants. Develop savings estimates both in raw terms and per Btu of annual load displaced for secondary heating fuels, and the approximate take back effect measured in increased annual thermal load on the heating systems.

Potential Budget: $100,000 - $200,000

Study Name: HES Audit Optimization Study (RES 30)
Research Area: Residential
Type of Study: Process Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to conduct research to identify opportunities for optimizing the Home Energy Services (HES) initiative audit tool and delivery for program contractors and customers. This study builds upon findings from the 2014 HES initiative delivery assessment, which found that there is an "opportunity for information overload" because of the variety of offerings and programs presented to customers during the audit and that some Energy Specialists struggle with having enough time to deliver all of the program components and promote other Mass Save incentives during their limited time in customers' homes. Employing a variety of qualitative research methods, in-depth insights will be gathered from a range of program stakeholders and make recommendations for optimizing the home energy assessment process.

Research Questions:

This research seeks to identify opportunities for improving the HES home energy assessment for lead vendors, home performance contractors (HPCs), and customers to more effectively disseminate information, encourage cross-program participation, and increase close rates.

High-Level Description of Approach/Methodology:

Task 1: HPC Roundtable Discussion and Lead Vendor Interviews

Qualitative insights will be collected from representatives of both HES delivery channels. A roundtable discussion will be facilitated with eight to ten participating HPCs and interviews will be conducted with four to eight lead vendor field staff to identify Energy Specialists' suggestions for audit tool optimization and delivery improvements. The PAs and EEAC Consultants will be asked to identify high-priority research topics and help develop discussion guides.

Task 2: Participant Customer Focus Groups

The evaluators will conduct six focus groups with HES participant customers to explore customer experiences with the home energy assessment process in depth and identify suggestions for improving assessment content and delivery. Screening criteria, group segmentation, and discussion guides will be developed collaboratively with the PAs and EEAC Consultants. Focus groups will be segmented based on one or more factors—e.g., geography, delivery channel, and/or participation type (audit-only versus installed major measure)—and qualitative findings from these groups will identify similarities and differences between customer segments.

Task 3: Analysis, Reporting, and Study Design for Future Research

Key themes, findings, and recommendations will be summarized across all research tasks, which will be incorporated into an overall HES annual report. In addition, the Team will make research design recommendations for a follow-up study that will explore several different approaches to delivering the home energy assessment (based on findings and suggestions from the focus groups, roundtable discussion, and interviews) and perform an experimental design to determine the effectiveness of each approach. These research design recommendations will identify methods for assessing strengths and weaknesses of different approaches using different protocols and strategies for separate participation populations.

Value Proposition:

The 2014 HES initiative delivery assessment found that both HPCs and lead vendors believed that customers often did not fully understand the Mass Save offerings and could easily be confused and overwhelmed; findings from the participant customer survey support that belief—some customers reported being unsure of what they qualified for, while others felt there were too many Mass Save options and too much information presented to them. In addition, the study identified differences in cross-program participation rates by delivery channel. The study determined that HPC customers had lower rates of cross-program participation than lead vendor customers, which is probably, in part, a result of a lack of understanding by the HPCs regarding program offerings and less proactive promotion among the HPCs of non-HES initiative offerings. This proposed research will help inform improvements to the current HES initiative audit tool and delivery to increase close rates and rates of cross-program promotion and participation by helping Energy Specialists optimize their limited time in customers' homes. In addition, the insights gathered through this study will inform recommendations for an experimental study design, which the PAs may implement to determine the effectiveness of various approaches.

Potential Budget: $160,000 - $185,000

Study Name: HES Quality Control Study (RES 31)
Research Area: Residential
Type of Study: Process Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to conduct a comprehensive review of the HES initiative quality control procedures and outcomes and to gather supplementary insights regarding stakeholder experiences with the quality control process. The 2015 *Home Energy Services Initiative and HEAT Loan Delivery Assessment* qualitatively explored HPC and lead vendor experiences with the quality control for the initiative. However, that study did not assess the HES quality control procedures or outcomes in-depth and did not explore the quality control process from the perspective of the third group of contractors—the independent installation contractors (IICs)— who perform work on behalf of the program. This study will complement findings from the HES delivery assessment by conducting in-depth interviews with program stakeholders, reviewing quality control procedures, and assessing quality control outcomes.

Research Questions:

This research seeks to:

- Assess HES initiative quality control procedures and processes
- Identify key quality control outcomes
- Explore IIC experiences with the quality control process

High-Level Description of Approach/Methodology:

Task 1: Review Quality Control Standards and Conduct Stakeholder Interviews

The evaluators will conduct a comprehensive review of existing program quality control standards and protocols from PAs, lead vendors, and the statewide quality control auditor to identify standard quality control procedures. To provide additional context and understanding regarding quality control, 10-15 interviews will be conducted with a range of program stakeholders, which may include the statewide quality control auditor, PA program managers, and lead vendors.

Task 2: Collect and Analyze Quality Control Data

Aggregate and analyze available quality control data collected by the lead vendors and statewide quality control auditor to identify key outcomes of the quality control process. These key outcomes may include the number of quality control visits conducted, proportion of quality control visits resulting in callbacks to fix work, proportion of callbacks by contractor type, and frequent issues identified through the quality control process. Other high-priority quality control outcomes desired through this research will be identified collaboratively with the PAs and EEAC Consultants.

Task 3: IIC Interviews

To complement the HES initiative delivery study, interviews will be conducted with 10-15 IICs to understand the IICs' experience with the quality control process, including the feedback they receive from lead vendors and the statewide quality control auditor and any issues they have encountered with the process. These results will compare findings from interviews conducted with HPCs in 2014 to identify similarities and differences between HPC and IICs.

Task 4: Analysis and Reporting

Key themes, findings, and recommendations will be summarized across all research tasks, which will then be incorporated into an overall HES annual report.

Value Proposition:

Through the 2015 HES initiative delivery assessment, an extensive review of the quality control process, procedures, and outcomes was identified as a high-priority evaluation issue for future research. The HES initiative delivery assessment did not assess the HES quality control procedures or outcomes in depth and did not explore the quality control process from the perspective of IICs. This proposed study will conduct a comprehensive review of the HES initiative quality control process to explore quality control in greater depth and provide a quantitative assessment of quality control outcomes. Furthermore, interviewing IICs will provide an additional perspective to complement and provide additional context for the qualitative insights gathered from HPCs and lead vendors in the 2015 study.

Potential Budget: $60,000 - $95,000

Study Name:	Explore Opportunities to Overcome Split Incentive Barriers for Multifamily Program Participation (RES 33)
Research Area:	Residential
Type of Study:	Process Evaluation
Applicable Fuel(s):	Electric & Gas

Overall Study Goal:

According to PA representatives, the 2015 Multifamily Process Evaluation revealed that the split incentive was second only to the lack of program awareness as the biggest barrier to program participation. This study would explore the opportunities available to the PAs for mitigating the split incentive barrier.

Research Questions:

This study would collect information about the feasibility and potential for combining various approaches to understanding and resolving the issue of split incentives in the PAs' multifamily program.

High-Level Description of Approach/Methodology:

Task 1: Finalize Work Plan

The first task will be to develop a more detailed work plan. As noted below, the study will rely on secondary research (such as literature and best practices reviews) as well as primary research (such as in-depth interviews with program managers of benchmarking programs and focus groups or surveys with both renters and multifamily property owners).

Task 2: Literature/Best Practices Review

The Team will conduct secondary research specifically to identify and understand successful approaches to address the split incentive barrier in multifamily or other tenant/landlord situations that have been undertaken in other jurisdictions with a similar program offering. This research will better inform the PAs understanding of the split incentive barrier and will also suggest possible program solutions. One program strategy that is growing in popularity is the idea of benchmarking the energy efficiency of the multifamily building stock and sharing related operating cost information with multifamily building owners, managers, and investors. Other approaches include regulatory mechanisms, energy concierge services, green leases, and promotion of non-energy benefits of energy efficient projects.

Task 3: Interviews with Program Implementers

Once identified through Task 2, the Team will conduct interviews with program implementers who have employed a benchmarking approach (or other identified approaches) to address split incentives. The goal of these interviews is to gain an understanding of the approaches taken and the program and market conditions necessary for these approaches to succeed.

Task 4: Focus Group/Survey of Multifamily Tenants and Landlords

Under this task, the Team will interview both tenants and landlords of multifamily housing units in Massachusetts. The purpose is to increase the Team's understanding of the split incentive barrier, while testing the market receptiveness to benchmarking and other potential approaches to overcoming the split incentive barrier from both perspectives. This research will build on the primary research conducted during the 2014 Process Evaluation and will be informed by the research conducted in Task 2 and Task 3 above.

Task 5: Analysis

Once data collection is complete, the Team will conduct the analyses required to address the specific researchable questions identified in the final scope of work.

Task 6: Reporting

The PAs and EEAC Consultants will be provided with a written report containing the analysis results.

Value Proposition:

The split incentive barrier remains a challenge for the multifamily program. By understanding best practice program designs from other jurisdictions, the PAs can better align their multifamily program design to address this barrier. In addition, by exploring potential program design enhancements with rental customers and landlords in their own service territory, the PAs will obtain feedback from their own customers on the potential program design. Finally, by conducting this research in late 2015/early 2016, the PAs will have this information in a timely manner to revise the multifamily program early in the 2016–2018 program cycle.

Potential Budget: $50,000 - $75,000

Study Name: HES Impact Evaluation (RES 34)
Research Area: Residential
Type of Study: Impact Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to recalculate realization rates of vendor calculated savings in the HES initiative.

High-Level Description of Approach/Methodology:

Task 1: Data Cleaning/Processing

The data management team will be responsible for all data cleaning, screening, and preparing the data for analysis. In addition, the data management team will ensure all personally identifiable information are handled properly and all data are cleansed before handing over to the analysis team.

Task 2: Billing Analysis

An in-depth exploration into saving estimation (whole house and measure specific) through a combination of PRISM and Conditional Savings Analysis (CSA). The results will enhance understanding of achieved savings and support the assessment of the accuracy of the *ex ante* savings. The team anticipates billing analysis servings as the primary approach for estimating impacts for average households, as well as measures with large energy savings or those having been installed at high frequency in the population.

Task 3: Simulation Modeling

As a compliment to Task 2, the evaluators will run simulation models on a statistically significant sample of homes that covers all configurations of home types, locations, fuel type, end-use combinations, and energy consumption levels. This approach will be used to estimate impacts for measures without reliable billing data (e.g., oil) and that have smaller expected savings. Tasks 2 and 3 will be conducted in tandem. A billing analysis (PRISM and CSA models) will be run on the population of the participants and on a comparison group. The realization rates from these models will be estimated. On another set of homes that have received simulation models, billing analysis will be used with the simulation results as explanatory variables and then readjust the simulation models to reflect what billing analysis reveals. The process will be iterative to obtain the best possible *ex ante* values for future programs. All simulation models will also use billing data to calibrate their estimates.

Task 4: Engineering Algorithm Analysis

The Team will conduct the engineering assessment of the algorithms along with the iterative process described in Tasks 4 and 5.

Task 5: Savings Calibration

Tasks 2, 3, and 4 running in tandem along with careful calibration against actual (and weather normal) consumption will provide best estimates of measure-level and whole-house savings.

Optional Task 6: Follow-up QA/QC On-sites

Because the proposed billing analysis will allow savings to be determined at individual sites, the Team proposes rating site in terms of their performance (both in absolute terms and relative to the *ex ante* values). The Team will conduct billing analysis, CSA, simulation modeling, and detailed engineering assessment (methods described above) and conduct site visits to identify the reasons for observed performance. During site visits, the Team will meter whole house and selected end uses for appropriate durations to estimate savings at the measure level.

Value Proposition:

In addition to the large expected savings and significant contribution to the overall portfolios, HES is the gateway to many other PA offerings. An understanding of its impacts and overall delivery is critical to achieving the planning goals.

Potential Budget:	**Tasks 1 – 5:**	$200,000 - $300,000
	Task 6:	$175,000

Study name: Determine Appropriate Multifamily Program Interventions for Condominiums (RES 41)
Research Area: Residential
Type of Study: Process Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The 2015 *Multifamily Process Evaluation* found that condominiums differ enough from other multifamily buildings in size and ownership characteristics to warrant an investigation into alternative program strategies to achieve success in this market subsector. This study is intended to be a quick but detailed study of the unique characteristics and challenges of the condominium market and any possible program design opportunities that could serve these customers.

Research Questions:

The Team will research specific approaches to increasing energy efficiency program participation in the condominium subsector that have been successfully implemented by other jurisdictions with similar program design. This evaluation seeks to gain a deeper understanding of these condominium-focused program strategies and the market and program conditions necessary for these approaches to succeed.

High-Level Description of Approach/Methodology:

Task 1: Document Current Program Approach

To gain a complete understanding of each PA's program approach to multifamily buildings and internal best practices, the evaluators will interview each PA's program manager and program implementer to ask for about the current approach to the condominium market. Any findings will be included in the discussion of specific approaches in the final memo.

Task 2: Literature/Best Practices Review

Under this task, the initial research conducted during the 2015 *Multifamily Process Evaluation* will be built upon to gain additional information about successful approaches to engaging condominiums in other jurisdictions with a similar program offering. For example, Puget Sound Energy and Energy Trust of Oregon have undertaken an approach where the multifamily market is segmented and a single program representative focuses on each segment, including condominiums. This research will suggest potential program solutions to increasing uptake in the condominium market.

Task 3: Interviews with Program Implementers

Once successful condominium-focused programs have been identified through Task 2, interviews will be conducted with the program implementers who have employed one or more of these approaches. The goal of these interviews is to gain an understanding of the approaches taken and the program and market conditions necessary for these approaches to succeed.

Task 4: Analysis/Reporting

Once data collection is complete, analyses will be conducted to address the specific researchable questions identified in the final scope of work.

The PAs and EEAC Consultants will be provided with a written memo containing the analysis results.

Value Proposition:

The condominium market requires a different approach to customer engagement than have been employed historically. By understanding best practice program designs from other jurisdictions, especially in Massachusetts, the PAs can more effectively engage the condominium market in the multifamily program.

Potential Budget: $30,000 - $60,000

Study Name: Zero Net Energy Home Potential (RES 46)
Research Area: Residential
Type of Study: Assessment
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is two-fold: (1) to conduct a market characterization study to understand the current stock of Zero Net Energy (ZNE) homes in Massachusetts and (2) to determine if any additional savings that can be obtained from these projects going forward. This will answer questions such as how many ZNE homes there are, where they have been constructed (in the state and PA territory), and whether homeowners and builders have been taking advantage of current program offerings in the construction and furnishing of the houses. If these homes have been participating in current programs, this portion of the study will also assess how much energy savings and incentive dollars have been coming from/going to these projects. The study will also identify potential savings, costs, cost-effectiveness, and the likelihood of success of two to three hypothetical initiatives that could promote new ZNE single-family homes in Massachusetts.

A report will document the home design strategies, high-performance building practices, energy-efficient products and materials, and distributed generation strategies that builders can use to construct a ZNE home rather than a standard code-built home. The report will include:

- List of architectural elements, energy-efficient building products and construction materials, and renewable energy systems that builders can use to build a ZNE home
- Associated costs for each identified measure/product
- Labor costs for construction/installation
- Three to four packages of measures and building strategies that are commonly bundled in ZNE homes but which, individually, may not enable a building to reach the ZNE standard
- Cost-effectiveness analysis of each package and a hypothetical average complete building
- Assessment of modifications that would be required to maximize the peak demand reduction contribution from existing ZNE home projects (this is a demand reduction-centric perspective rather than an energy-centric focus) and the impacts these would have on demand reductions, energy savings, and cost.

Research Questions:

The Team proposes to conduct research to inform these questions:

- What is the current state of the ZNE home market in Massachusetts and in each PA territory, to what extent are these projects taking advantage of existing program offerings, and, if they are, how much savings are these projects generating (and how much incentive dollars are going to them)?
- What are the total savings available from ZNE homes by kW, kWh, and therm relative to:
  - A standard home built to code and/or a standard home built to current market practices?
  - An ENERGY STAR® home?
- What are the costs associated with building practices, equipment, and systems used in each of these scenarios?

- What are the savings and costs associated with three to four packages of selected measures/ building practices that are needed to get to a ZNE home (or are common in these homes) but which individually may not be sufficient to reach the ZNE standard?
- Is it feasible to design and develop a cost-effective ZNE homes initiative and, if so, what target measures and incentive strategy will produce the best results?

High-Level Description of Approach/Methodology:

Task 1: Collect, Compile and Analyze Secondary Research

There are numerous existing reports, studies, and articles on ZNE homes. The Team will review these materials, including ZNE certification records, to help identify completed homes and determine the appropriate research questions in Tasks 2 and 3.

Task 2: Market Characterization

Cadmus will develop a summary of ZNE homes by PA territory, work with implementers to screen those projects for participation in existing programs, and assess the energy savings from those projects attributable to the current programs and associated incentive payments. This task will be conducted parallel with Task 3 to capture any projects not identified in Task 1 and to minimize the number of surveys/interviews administered to individual customers/builders to obtain the information needed for each task.

Task 3: Primary (Survey) Research on Practices

The Team will conduct interviews with home builders, architects, tradesmen, and owners to understand common building practices and materials used in both code-built and ZNE homes in general, and in Massachusetts projects specifically, and any variations from nationwide practices that may be the focus of some of the secondary research.

Task 4: Report: The Team will prepare a largely data-focused summary of findings from Tasks 1, 2, and 3. This summary will mainly comprise lists and prices of the design features and materials for the ZNE home and comparison home(s), measure packages, and the savings and cost-effectiveness analysis associated with each.

(Optional) Task 5a Load Shapes from PA Time-of-Use (AMI) Meters

By analyzing existing AMI meter data, the Team can refine the savings estimates—in particular peak demand—derived in Tasks 1 and 2. Depending on home characteristics, because of the on-site renewable component of ZNE homes, the peak demand savings could be worth investigating in greater detail.

(Optional) Task 5b: Load Shapes from Site Visits

If AMI meter data are not available in enough ZNE homes and additional understanding of load shapes is of interest, the Team can conduct site visits to install whole-house metering equipment. While on site, the Team could also obtain information on building comfort, satisfaction, and other characteristics and verify the performance of on-site renewable energy equipment.

(Optional) Task 6: Market Adoption/Interest Study

After assessing the cost-effectiveness of ZNE homes and/or packages of relevant measures, the Team would conduct a survey of targeted Massachusetts residents and builders to assess their interest in hypothetical program offerings. Targets would include recent homebuyers, potential homebuyers, builders, and architects. This research could involve telephone surveys and/or focus groups.

Value Proposition:

The Evaluation Team understands that there has been significant stakeholder interest in ZNE homes. This study will assess the opportunity for cost-effective savings from ZNE homes, and provide the basis for and informed response from PAs to stakeholders.

Potential Budget: $200,000 - $350,000

Study name: Customer Profile Study, Phase 2 (RES 47)
Research Area: Residential
Type of Study: Market Characterization/Assessment
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

Building upon the findings of the 2013 *Residential Customer Profile Study (RCPS*), this study will incorporate data from 2014 and 2015 program years to provide a similar understanding of program participation, savings, and incentive expenditures across Massachusetts during these years. With three years of program data receiving consistent analysis, an analysis of patterns and trends can be undertaken.

Research Questions:

The Team proposes to conduct research to answer these questions:

- How are program participation, savings, and incentive payments in 2014 and 2015 distributed across Massachusetts and across PAs?
- How have these distributions changed from year to year?
- Do the demographics of participants stay the same or exhibit some change over time?

High-Level Description of Approach/Methodology:

Task 1a: Request Data

A data request for 2014 and 2015 PA program tracking and billing data for all residential and low-income customers will need to be submitted to the PAs. By applying the lessons learned from the 2013 RCPS, the Team will define data needs and request 2014 and 2015 data in standardized format from the PAs and implementers. The Evaluation Team data management team will also acquire necessary third-party data and software to replicate the full dataset developed for the 2013 report.

Task 1b: Summarize/Pre-Reconciliation of PA/Implementer 2014 Data

Prior to making any modifications to the database architecture in which 2013 data are housed and into which multiple databases and files will be merged, the Team will conduct a high-level analysis will need to be conducted of, and report summary statistics on, on t the 2014 data received in response to the data requests. This will ensure that the files received are correct and sufficient for proceeding with a high degree of certainty that final reconciliation efforts will require minimal adjustments.

Task 1c: Summarize/Pre-Reconciliation of PA/Implementer 2015 Data

As with the 2014 data in Task 1b, the Team will conduct high-level analysis of, and report summary statistics on, will need to be conducted on the 2015 data received in response to the data requests. This will ensure that the files received are correct and sufficient for proceeding with a high degree of certainty that final reconciliation efforts will require minimal adjustments.

Task 2: Finalize Project Scope and Timeline

In parallel with Task 1, the Team will coordinate with PAs and EEAC consultants to define the key patterns and trends of interest, determine any additional analysis desired (for 2013 and subsequent years), and any necessary database architecture changes to create an outline of the final report/deliverables for this study.

Task 3a: Integrate 2014 PA Data

2014 data obtained from PAs and implementers will be cleaned of personally identifiable information (PII) and integrated into a single database with the existing 2013 data.

Task 3b: Integrate 2015 PA Data

2015 data obtained from PAs and implementers will be cleaned of PII and integrated into a single database with the existing 2013 and 2014 data.

Task 4a: Integrate External 2014 Data

2014 data obtained from external sources—including U.S. Census, address validation, and GIS data—will be integrated into a single database with the existing 2013 data.

Task 4b: Integrate External 2015 Data

2015 data obtained from external sources—including U.S. Census, address validation and GIS data—will be integrated into a single database with the existing 2013 and 2014 data.

Task 4c: 2014 Data Reconciliation

The Team will create summary reports from analysis of data imported into the database and meet with individual PAs and implementers to validate the import reconciliation results. This task assumes that because of the validation step in Task 1b, no additional files will be needed from PAs or implementers; this will be a discussion of refinements to the Team's analysis to improve consistency with RCPS savings, participation, and incentive levels with those available on masssavedata.com, benefit-cost ratio (BCR) tables, and other PA records.

Task 4d: 2015 Data Reconciliation

As with the 2014 data from Task 4a, the Team will create summary reports will need to be created from analysis of data imported into the database and meet with individual PAs and implementers to validate the import reconciliation results. This task assumes that because of the validation step in Task 1c, no additional files will be needed from the PAs or implementers; this will be a discussion of refinements to the Team's analysis to improve consistency with RCPS savings, participation, and incentive levels with those available on masssavedata.com, BCR tables, and other PA records.

Task 5: Final Analysis and Reporting

The Team will complete analysis and develop final deliverables according to the outline and products defined in Task 2. Should enough time elapse between the completion of Tasks 1b and 1c, Task 5 could be broken into two to three parts with separate 2014, 2015, and three-year deliverables.

(Optional) Task 6: Online Reporting

In addition to, or in place of, a PDF report described in Task 5, the Team could develop an interactive, updatable reporting site to allow users to obtain specific data.

(Optional) Task 7: Ad Hoc Data Management Consulting

Where data are not available in standard formats for inclusion into the RCPS database, consulting services are available to individual PAs and implementers to assist in the development of data that will meet Task 1a data request needs. These services will be charged on a time and materials basis as individually negotiated.

(Optional) Task 8: Custom Reporting and Data Extracts

Where needed by individual PAs, implementers, or for other evaluation/program contracts, ad hoc database analytic and reporting services are available. These services will be charged on a time and materials basis as individually negotiated.

Value Proposition:

While stakeholder interest has been high in the results of the 2013 RCPS, the greater value of this type of analysis comes from repeating the effort across multiple years. In addition to increasing the reliability of the analysis by filling in gaps from programs that may not have a lot of activity in certain areas in a single year, multi-year analysis will begin to provide insights on program trends and patterns.

Potential Budget: $750,000 - $1,000,000

5.2 NON-RESIDENTIAL STAGE 1 WORK PLANS

Study Name: C&I Lighting and Controls Market Effects Study
Research Area: Commercial & Industrial
Type of Study: Market Effects Study
Applicable Fuel(s): Electric

Overall Study Goal:

The goals of this research are to quantify market effects associated with high-performance T-8 lamps, and conduct a market effects baseline study for C&I Lighting Controls as DNV-GL recommended through the February 26, 2015 memo "Recommended Methods for Assessing Market Effects of C&I Lighting and Controls Programs (Final)" submitted under the Cross-cutting research contract. While these are two distinctly different studies, this research will leverage DNV-GL team's market effects expertise and combine the studies under one project.

High-Level Description of Approach/Methodology:

Work Plan Development and Working Group Meetings

While the framework for the retrospective T-8 market effects study and the prospective lighting controls baseline study was established through the Cross-cutting research area, that research was intended to identify the general market effects approach, leaving the detailed work plan for the C&I Evaluation team. DNV GL will hold monthly working group meetings to inform the PAs and EEAC Consultants of interim findings and key decision points.

Retrospective T-8 Market Effects Study

DNV GL will work closely with PA program and evaluation staff and EEAC consultants to develop the program logic and market models in graphic form. As discussed in detail in the February 26, 2015 memo, DNV GL's proposed approach to assessing program influence on the market for HP T8s will use the following analytic steps:

1. Leverage existing research to map the supply chain for low-wattage T8s.
2. Identify a comparison area.
3. Recruit and initiate distributor panels/conduct surveys in Massachusetts and the comparison area.
4. Conduct interviews with a sample of retailers and contractors, if indicated by the results of Step 1.
5. Compile data required to estimate gross and net savings.
6. Estimate net savings.

Prospective Lighting Controls Baseline Study

Given the relatively low level of program activity for controls, the team would undertake fairly low-cost research before proceeding to a full-scale baseline study. This study would begin with a review existing lighting controls research in Massachusetts. The team will also look to collect information on trends in sales, customer response, observed program effects, pricing, and performance from Massachusetts distributors and electrical contractors. The C&I evaluation team will present the results of this research to the PAs along with recommendations regarding whether to proceed to a full baseline study and, if so, the team will develop a high-level work plan and budget. If we do not move forward with the baseline study now, the evaluation team will continue to monitor program activity and developments in lighting control technology and markets via the aforementioned distributor panel. If purchases of controls begin to increase through the program, outside the program, or both, we will notify the PAs and seek their views on whether to proceed with a baseline study. If the PAs decide to proceed to a full baseline study, the C&I evaluation team will develop a detailed work plan.

Potential Budget: $300,000 - $450,000

Study Name: Comprehensive Design Approach (CDA) evaluation
Research Area: Commercial & Industrial
Type of Study: Impact
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The primary goal of the impact evaluation of the CDA programs will be to quantify the electric and natural gas savings, as well as the electric demand reduction, attributable to the program in 2014. This will enable the team to assess whether the program is achieving the expected savings. Five years have elapsed since the last similar evaluation occurred (for electric savings only), and while realization rates from that effort were fairly high, the program has grown and changed in ways that make it important to reassess program performance.

High-Level Description of Approach/Methodology:

The DNV GL team's approach and methodology will be consistent with the procedures and protocols developed for previous rounds of custom site-specific impact evaluations. That said, CDA projects are unique in their complexity and analytical difficulty, given they require calibrated hourly building simulation models to estimate savings from measures that tend to be highly interactive. As a result, establishing a reasonable level of effort is key. As noted in the Task 1 description below, decisions about sample sizes and analysis rigor affect study costs dramatically, and the budget figures at the end reflect ranges for both.

Task 1: Work Plan Development

Establishing clear sampling objectives is critical because of the significant effort needed to perform rigorous M&V of each sampled CDA participant. The team will work with the PAs and EEAC Consultants to develop a work plan and sample design that addresses the desired statistical precision by PA, fuel type, and savings parameter. The work plan will also address these important scoping considerations:

- The appropriate level of data collection and analysis necessary to yield reasonably accurate results at the whole-building level. It may be worthwhile to reduce the rigor for some M&V aspects to allow for larger sample sizes.
- The need to calculate and report more granular results (such as at the measure level) for each project.
- Whether or not to include Advanced Buildings (AB) projects, as well as multiple program years.

Once these major factors have been established, the team will develop a project schedule that ensures we will complete the study within one year of work plan approval.

Task 2: Site M&V Planning

The team will develop detailed measurement and evaluation plans for each sampled project for PA approval. These plans will outline on-site methods, strategies, monitoring equipment placement, calibration and analysis issues.

Task 3: Data Collection

This will include physical inspection and inventory, interviews with facility personnel, observation of site operating conditions and equipment, short-term metering of usage, and perhaps even billing analysis. The team will incorporate customer energy management system (EMS) data should it be reliably available. Generally, both summer and winter monitored data are desirable to fully calibrate the building models. Monthly electric and gas billing data – or interval data if available – will be necessary for model calibration to actual performance. If desired, interviews could also assess progress implementing recommendations from the 2011 CDA process evaluation.

Task 4: Analysis

Using the program-developed building simulation models as a basis, the team will analyze collected data to verify measure implementation, and estimate hourly energy use and diversified coincident peak demand. Each site report will detail the specific analysis methods used for each project including algorithms, assumptions and calibration methods where applicable.

Task 5: Site Reporting

The team will prepare and submit site reports that document methodology and findings for each sampled project to the PAs for review.

Task 6: Program Reporting

The team will develop a comprehensive report that describes the methodology, findings, and recommendations from the combined site-level analyses and the extrapolated results.

Potential Budget: $200,000 - $400,000 (smaller sample, n=5)
$1,000,000 - $1,500,000 (larger sample, n=25)

Study Name: Impact Evaluation for Upstream Lighting Programs
Research Area: Commercial & Industrial
Type of Study: Impact
Applicable Fuel(s): Electric

Overall Study Goal:

The primary goal of the impact evaluation of the Upstream Lighting program will be to quantify the electric energy savings and demand reduction attributable to the program. This will enable the team to assess whether the program is achieving the expected savings as well as to identify any recommendations for improvement. The Upstream Lighting program was last evaluated in 2012, with a follow-up study of in-storage lamps conducted in 2014. Since the time of the prior evaluations, the program has grown and changed in ways that make it important to reassess program performance. Due to this growth and the implementation of programmatic changes, a secondary goal may be to conduct some process evaluation work along-side the impact evaluation. This one-pager focuses on impact evaluation, but process evaluation can be included in additional tasks.

High-Level Description of Approach/Methodology:

The DNV GL team's approach and methodology will be consistent with the procedures and protocols developed during the previous round of Upstream Lighting impact evaluation. The impact evaluation will require on-site visits and metering of lighting hours of use for a randomly selected sample of locations which purchased bulbs through the Upstream Lighting program. A process evaluation would use a series of surveys conducted with end-users, program implementers, lighting distributors and contractors.

Task 1: Work Plan Development

The DNV GL Team will work with the PAs and EEAC Consultants to develop a work plan that satisfies the objectives of this study.

Task 2: Sample Design

The DNV GL team will develop a sample design that meets the desired statistical precision targets for key savings parameters such as energy and peak demand savings, as well as other factors such as peak coincidence factors and HVAC interactive effects. The team will work with the PAs and EEAC consultants to determine if disaggregation by measure group is now appropriate within this program. An additional process evaluation sample design may be developed depending on the PA/EEAC desire to conduct some process work. A process evaluation sample would include participating end-users, lighting distributors and contractors.

Task 3: Data Collection

Data collection for the impact work would include physical inspection and inventory, interviews with facility personnel, observation of site operating conditions and equipment, short-term metering of lighting hours of use. Evaluators will attempt to determine pre-existing lamps from interviews with facility staff while performing the on-site data collection. If a process evaluation is undertaken, the team will conduct telephone surveys with participating customers, which will also be used as a data point for estimating net-to-gross savings as well as providing information on baseline technologies for the impact study. The process team will also conduct in-depth interviews with lighting distributors and contractors; these too can inform the net-to-gross analysis.

Task 4: Impact Analysis

The DNV GL team will combine the data gathered during the site visit with data provided by the PAs to estimate gross savings realization rates for annual kWh. We will also use the combined data to estimate gross savings results for other relevant savings factors. The study will also strive to produce new estimates of delta watts and annual hours of use that may be applied by the PAs going forward. All reporting at this level will be sample weighted and statistically representative of the population or appropriate population sub-groups.

Task 5: Estimating Net-to-Gross

Similar to the earlier evaluation, the process team will use a triangulation of lighting distributors, contractors and participating end-users to estimate net-to-gross.

Task 6: Reporting

The DNV GL team will develop a comprehensive report that describes the methodology, findings, and recommendations from the combined site-level analyses and the extrapolated results. The report would also include findings and recommendations from the process evaluation.

Potential Budget: $250,000 - $350,000 (Impact Evaluation)
$125,000 - $175,000 (Process/NTG)

Study Name: Prescriptive/ Custom Gas Steam Trap Measure Phase 2 Evaluation
Research Area: Commercial & Industrial
Type of Study: Impact
Applicable Fuel(s): Gas

Overall Study Goal:

The Steam Trap Measure Phase 2 Evaluation will improve the accuracy of both custom and deemed savings estimation for steam trap repair/replacement measures as well as increasing the consistency of savings estimation for the former. It also will take advantage of the expertise of a "steam trap stakeholder group" convened for tool development to recommend changes to increase broader participation and increase savings in the program.[16]

High-Level Description of Approach/Methodology:

Task 1: Work Plan Development

DNV GL team will work with the PAs and EEAC Consultants to develop a work plan and project schedule that ensures we will collect information needed for the plan by mid-September. The plan will include a preliminary list of candidate stakeholders.

Task 2: Data Gathering Phase with Preliminary Analysis

- Supplement Phase 1 with MA custom results and any additional information
- Prepare material for workshop, including test cases, calculators, and BCRs

Task 3: Convene Stakeholder Group

- Recruit attendees and convene a half-day in-person work shop, potentially with a webinar option, on tool design and ways to increase measure penetration

Task 4: Proposed Final Tool

- Build a standardized steam trap savings calculator with a limited number (nominally between 5 and 10) of system and trap variables that affect leak rate.
- Calibrate the tool using results from prior pre/post trap replacement billing analysis conducted during past program evaluations and possibly other sources.
- Develop a prototypical mixture of the aforemented variables such that the mixture is representative of the MA leaking steam trap population. In this manner, one would be able to estimate a single deemed savings value from the calculator.
- Distribute the calculation tool to the PAs along with test cases, and integrate on any final modifications.
- Work with PAs, their technical assistance providers, and steam trap vendors to support widespread adoption of the new calculator in custom projects.

Task 5: Primary field research to measure flow rate as a function of tool variables

- Identify a vendor willing to allow accompaniment during diagnostic visits
- Conduct site visits and leak characterization at up to 15 sites, until there are at least 10 sites with expected trap savings in excess of 8% of bills. Conduct billing analysis of those 10.

---

[16] The recently completed steam trap phase 1 study set the stage for roll-out of a consistent tool. It included a survey of practices in other jurisdictions, a survey of local vendors, an analysis of the two existing tools, and a recommendation for measure life.

- Supplement the relatively moderate number of prior evaluation-based billing data sites with this new data to make the calibration effort more defensible.

Task 6: Re-convene Stakeholder Group for webinar presenting results

- Refine tool calculations and usability. Estimate deemed savings and report on ways to increase market penetration.

Task 7: Reporting

The team will report on the findings of the survey and associated analysis. We will work with the PAs to ensure they understand the how to interpret the results for use in the next three-year plan.

Potential Budget: $75,000 - $125,000

Study Name: Methods to Increase Participation and Energy Efficiency of Mid-sized Customer
Research Area: Commercial & Industrial
Type of Study: Market Assessment
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to develop useful strategies to increase the level of service to mid-sized customers. It will provide a needs assessment and gap analysis of electric and gas mid-sized customers. This study will contrast savings and participation rates of mid-sized electric and gas customers to those of small and large customers over time (2011-2014). This research is intended to expand on the 2013 Mid-sized Customer Needs Assessment by considering depth of savings and participation across both fuel types and multiple years of analysis. The analysis will seek to better understand both the barriers to and opportunities for participation by this important group. We will investigate level of service and program engagement differences across fuels, and recommend approaches for engaging market actors to increase the depth of savings.

We recommend exploring the following research questions:

1. To what extent are mid-sized customers aware of the full range of energy efficiency programs available?
2. How are mid-sized participants and non-participants most likely to receive and respond to the PAs' program outreach efforts?
3. What are the characteristics as well as program and vendor experiences of mid-sized program participants, and do these characteristics and experiences result in lost opportunities and/or suggest new forms of targeted communications, outreach or services?
4. How can the PAs enhance their existing eligible measure lists, incentives, delivery mechanisms, and vendor practices to maximize participation and depth of savings across electric and gas measures?

High-Level Description of Approach/Methodology:

<u>Task 1: Work Plan Development</u>

The DNV GL team will work with the PAs and EEAC Consultants to develop a work plan that satisfies the objectives of this study.

<u>Task 2: Exploratory Data Analysis</u>

We will work with the PAs and EEAC Consultants to update the definitions of customer size, particular focus is needed for gas customers to meet the study objectives that will be discussed in detail in the Stage 2 work plan. We will work with the PAs to address differences in customer size classifications across service territories. We will employ DNV GL's account-matching process that geocodes accounts to a physical location, and standardizes billing, program tracking, and other firm-o-graphic data sources. This will enable us to link electric and gas accounts, and to identify the electric and gas provider and size for each account in Massachusetts.17 The budget for this task will depend upon the level of confidence in the logical rules used to isolate unique customers. We also recommend mining the Existing Buildings On-site Assessment Study data and C&I Evaluation Database to identify groups of mid-sized customers that may represent opportunities for targeted services. The DNV GL team will coordinate

---

[17] Linking of electric and gas accounts is also being proposed in a separate Stage 1 Work Plan underdevelopment (i.e., Enhanced Customer-Level Database Capabilities). If the PAs and EEAC decided to move forward with both studies DNV GL will coordinate and modify the budgets, timelines and analysis.

with the (proposed) Assessment of Share of Incentivized High Efficiency Equipment study to include survey questions targeted at mid-sized customers to better understand their energy decision making practices.

Task 3: Assessment of Marketing Strategies and Vendor Practices

We will conduct a series of IDIs and focus groups with program staff, participating and non-participating vendors, and mid-sized, large and small participants and non-participants that serve this market to determine the most effective means of targeting mid-sized customers, overcoming barriers to participation, and coordinating services across fuel types. The goal is to identify barriers to and drivers of participation through extended conversations. Budget scenarios for this task vary depending on the number of in-depth interviews and whether off-site or on-site focus groups are also completed.

Task 4: Hypothesis Testing and Upstream Analysis

For the medium and high budget scenarios, we will execute a series of customer and contractor surveys to obtain information on barriers and opportunities for mid-sized, small and large gas customers who have the same and differing size classification based on their electric consumption. For the high budget scenario, we recommend supplemental interviews with participating and non-participating contractors. This information will be used to test hypotheses developed from the data mining and market analysis tasks.

Task 5: Reporting Products to Complete the Feedback Loop to Implementation

Depending upon the rigor-level desired by the PAs and EEAC Consultants (note wide budget range); we will develop up to three interrelated products that will complete the feedback loop between evaluation and implementation:

Reporting Product	Description	Level of Rigor
Summary of approaches and marketing analysis	Summarize the existing approaches and marketing practices for providing solutions for mid-sized customers, and recommend improvements or new approaches based on our analysis.	All
Enhanced marketing tools	Linking electric and gas customers to provide the PAs with linked electric and gas accounts.[18] We will define potential barriers to increased depth of savings by measure according to customer and program characteristics identified through data mining and primary research to map potential barriers to customers based on known characteristics.	Medium and High
	Database of electrical, mechanical, thermal, and comprehensive vendors who	Medium and

[18] We will work with the PAs to develop the level of detail the PAs are comfortable sharing without violating customer confidentiality

Reporting Product	Description	Level of Rigor
	may provide services to mid-sized customers.	High
Review of non-traditional approaches to measure savings	Summarize alternative approaches – memo summarizing approaches for targeting mid-sized electric and gas customers such as midstream and upstream incentives, recommended process changes. Best practices for custom program implementation for mid-size electric and gas customers, leveraging the team's past and ongoing impact evaluation experience in Massachusetts as well as research into marketing practices in other states and industries such as telecom, banking and financial services.	Medium and High High

Potential Budget: $300,000 - $650,000

Study Name: Assessment of the Share of Incentivized High Efficiency Equipment
Research Area: Commercial & Industrial
Type of Study: Market Assessment
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

Develop a better understanding of the share of recent high efficiency purchases that were incentivized by energy efficiency programs in order to provide information helpful in the process of baseline characterization and to assess market spillover and program influence on customer purchasing practices.

The Existing Building On-site Assessment Study ("C&I On-site Study") data is a rich set of information on the purchasing practices of non-residential customers. Combining these data with end use and measure group level energy efficiency program tracking data can inform the PAs on the share of recent high efficiency purchases incentivized by the energy efficiency programs and the share purchased outside the programs.

If the share of high efficiency measures purchased outside the programs is high, it may indicate that standard practice is higher than code and baselines and programs may need to be adjusted to encourage or move the market to a higher level of efficiency. A large share of high efficiency measures purchased outside the programs may also indicate that there is a substantial amount of program spillover. Assessing the level of non-participant spillover found in the C&I On-site Study customers could provide the PAs with a more informed measure of program attribution. Phone surveys can be used to distinguish standard practice installations from installations where customers indicate program influence in their decision to install a high efficiency measures, implying spillover. The project team will utilize the experience gained and methods developed for an on-going study in California using similar C&I on-site data.

High-Level Description of Approach/Methodology:

Task 1: Work Plan Development

The DNV GL team will work with the PAs and EEAC Consultants to develop a work plan and project schedule.

Task 2: Identify Technologies with Significant High Efficiency Purchases and Program Tracking Data

The team will mine the C&I On-site Study data and the program tracking data to identify customers and technologies with recently purchased high efficiency equipment that was not incentivized by the utility energy efficiency programs. This work will expand the analysis undertaken in C&I On-site Study to incorporate end use and measure group tracking data to determine if the specific high efficiency equipment identified in C&I On-site Study received a utility rebate. This process will lead to a characterization of recent purchases within C&I On-site Study as incentivized or not incentivized at the measure level. The process will also characterize the non-incentivized measures as being installed at sites that did or did not participate in energy efficiency programs for other measures. This process will lead to the development of a sub-sample of C&I On-site Study customers with detailed efficiency information on recently purchased equipment that can be used to better characterize the recent purchase market. Evaluation of these sites will lead to the development of a list of customers and technologies warranting additional analysis to help characterize program influence, attribution, and provide insight into baseline research. After the non-incentivized high efficiency measures are identified, the work will be coordinated with evaluation team efforts to update baseline assumptions. The team will also review the measures and determine which of the technologies may warrant further attribution research and develop a prioritized list for additional research.

Task 3: Primary Research

The team will conduct primary research to better characterize why customers are installing high efficiency measures outside the program. This research will lead to a spillover analysis and could aid with the baseline research. The findings from this research may also reveal information on why mid-sized customers appear to be under-represented in energy efficiency programs. Two research approaches for consideration include:

- Customer surveys – telephone survey based data collection from sites identified in the C&I On-site Study.
- Contractor and/or Trade Ally surveys – Contact contractors or other trade allies that were identified in the Customer Surveys as highly influential in the decision making process.

Task 4: Reporting

The team will report on the findings of the survey and associated analysis. We will work with the PAs to ensure they understand how to interpret the results for use in the next three-year plan.

Potential Budget: $185,000 - $300,000 (Dependent on number of high efficiency installations in P41/50 and how many contractor/trade ally surveys).

Study Name: Drivers of Net-to-Gross
Research Area: Commercial & Industrial
Type of Study: Net to Gross
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The primary objective of this study will be to identify factors that influence Net-To-Gross (NTG) ratios so that program designers and implementers can adjust their programs accordingly. Understanding the drivers behind NTG ratios is important, particularly because NTG is applied prospectively in annual reports and program planning filings. The factors that influence NTG ratios may include characteristics of the program design as well as characteristics of the participating customers; either of these could be addressed via program design and targeting. This study would identify the drivers behind NTG in order to provide actionable recommendations regarding program design and implementation.

Using secondary data sources including survey data already collected in Massachusetts, we will attempt to identify the key factors influencing NTG ratios and the degree to which they do so. These factors may include the following: rebates, program services, past participation, and firmographics, as well as research methodology, stage of program life cycle, and general economic conditions to the extent that supporting data is available. As we explore the data sources available for this study, we will refine the list of factors considered. In addition, we will explore how these NTG drivers may vary for different program designs (i.e., retrofit vs. new construction, custom vs. prescriptive) as well as by major measure types (e.g., lighting, HVAC, etc)..). To the extent that supporting data are available, we will investigate the effect of memorandums of understanding, multi-year agreements and chain/franchise status on NTG. Lastly, if supporting data are available, we will explore how these factors affect the various components of NTG, including freeridership and spillover, in order to better understand the underlying influences.

Because this study will rely on secondary data sources, it will be constrained by the type and granularity of the data collected by previous studies. Therefore, we envision this study as the first phase of the research; by leveraging existing data to inform the key research issues we can provide insight into the key drivers of NTG. If the results of this study indicate that further research is warranted, it will help shape the scope of the second phase.

High-Level Description of Approach/Methodology:

Task 1: Work Plan Development

The DNV GL team will work with the PAs and EEAC Consultants to develop a scope of work that meets their needs. As part of this task, we plan to conduct a few interviews with program managers in order to understand their perspectives and expectations.

Task 2: Literature Review

We propose to begin the study with a literature review of recent NTG studies to summarize the current state of the research regarding NTG drivers. As a starting point, we will review C&I NTG reports from Massachusetts and other regions (in particular California). We will review the C&I NTG studies conducted under the Cross-Cutting research area, which should provide a valuable source of information for Massachusetts programs. The electric NTG study was finalized in February 2015 and the gas NTG study was recently completed. In addition, we will review prior C&I NTG studies in Massachusetts, as appropriate. Lastly, we will review other Massachusetts NTG studies for sector-specific information, such as the LED spillover report.

Task 3: Re-analysis of Prior Survey Data

In this task we plan to mine the survey data collected for the Cross-Cutting C&I NTG studies in order to identify factors that influence NTG ratios. In particular, the survey of 1,407 electric respondents includes questions regarding program services provided such as rebates, financing, and energy audits as well as questions regarding prior program participation. We plan to analyze these survey data to assess the drivers of NTG by program type, measure type, and NTG component, to the extent that the survey data supports these analyses. In addition, we recommend leveraging the ongoing Existing Buildings On-site Assessment study as well as the associated Market Share Assessment study to identify measures with likely spillover and then explore possible reasons behind it.

Task 4: Overall Reporting

The team will provide interim reports on the findings of the literature review and the data re-analysis. In addition, we will develop an overall report that integrates the results of these two tasks and provides recommendations regarding the need for and outlines the scope of a possible second phase of the study.

Potential Budget: $75,000 - $125,000

Study Name: Process Evaluation of Upstream HVAC Program
Research Area: Commercial & Industrial
Type of Study: Process
Applicable Fuel(s): Electric

Introduction:

The Commercial & Industrial (C&I) Upstream HVAC/Heat Pump (HP) Program was launched in Spring 2013. The objective of the program is to increase sales of energy-efficient HVAC equipment in the C&I sector using an "upstream" program design. The program compensates participating HVAC distributors for discounting qualifying equipment. The program also works with participating HVAC manufacturers to insure the continued availability of the qualifying models and to help gain access to their product distributors.

Energy Federation Inc. (EFI) implements and markets the program with the Massachusetts Program Administrators (PAs) providing administrative oversight. EFI maintains an online service which allows participating distributors to apply for incentive rebates by entering sales data and other required information. The program is supposed to pay the distributors within 60 days of their online application. Currently the program provides buy-down discounts for the following types of HVAC equipment:

- Commercial unitary and split air conditioning systems (air cooled, including all types of heating);
- Commercial unitary air conditioning systems (evaporatively cooled, including all types of heating);
- Commercial unitary air conditioning systems (water cooled, including all types of heating);
- Commercial unitary heat pump systems (air cooled);
- Commercial unitary heat pump systems (water source);
- Ground water – water source heat pump equipment (open loop);
- Ground loop - water source heat pump equipment (closed loop); and
- Energy savings control and fan motor options.

Representatives of the PAs and the EEAC Consultants first expressed interest in the evaluation of this C&I Upstream HVAC/HP Program in early 2014 at which time, participation was lower than anticipated. At the time they decided to delay this research because the program implementer had started contacting HVAC contractors as part of their own research into barriers to participation. The PA representatives were concerned that if evaluators started contacting HVAC distributors so soon after the program implementer had, it would lead to confusion and respondent fatigue.

However, at the C&I evaluation planning meeting in February 2015, and in subsequent meetings and discussions, the PA representatives and the EEAC Consultants expressed new interest in a process evaluation of the C&I Upstream HVAC/HP Program. In August 2015 the evaluation team submitted a Stage 1 work plan for such an evaluation. In September 2015 the PA representatives and EEAC Consultants approved this Stage 1 plan to move to the Stage 2 scoping process. This document is the Stage 2 work plan.

Overall Study Goal:

The primary goals of this research are to investigate:

1) Why the Upstream HVAC Program is not getting a higher level of program activity (e.g., more units of rebated equipment) from participating distributors;
2) Why some HVAC distributors are not participating in the program; and
3) What changes in program design or delivery would lead to increased program activity.

Other important objectives of this evaluation include finding out what the program is doing successfully and better understanding the program's current impact on the market and options to further increase its reach into the market.

High-Level Description of Approach/Methodology:

Task 1: Work Plan Development

The DNV GL team will develop a more detailed work plan to guide our evaluation effort. This more detailed plan will expand on the research activities we are describing in this Stage 2 plan. It will contain information on sampling approaches, the research issues that will be addressed within the in-depth interviews, more additional detail on how we plan to measure market potential and detailed budgets. Because it is necessary to have a thorough understanding of the program to develop a good evaluation plan, we expect to complete this detailed work plan in parallel with the background research task described below.

Task 2: Background Research

The research task will allow us to gain a thorough understanding of the C&I Upstream HVAC/HP Program's design and delivery. It will include the following activities:

- *Review of program documents:* We will review all program documents including program informational and marketing collateral, process flow diagrams, marketing plans, logic models, etc.
- *In-depth interviews with PA program managers:* We plan to complete up to five in-depth interviews with PA representatives who are involved in managing this program. The topics we plan to cover include their roles in the design and delivery of the program, any recent or planned changes in the program, the program's marketing and outreach efforts, barriers to participation, aspects of the program that are going well, and any challenges the programs may be facing. Another program topic we plan to cover is whether there is any evidence of the downstream Custom program claiming projects that should be funnelled into the upstream program. Our 2014 interview with a PA program manager indicated that this was a concern, although the recent elimination of the downstream incentives for unitary HVAC equipment may be mitigating this effect.
- *In-depth interviews with implementation contractors:* We plan to complete five in-depth interviews with representatives of EFI who are involved in implementing the program. These would include interviews with program managers as well as with three field representatives who try to recruit HVAC distributors and manufacturers into the program.

  The topics we plan to cover with the EFI program managers would be similar to those we describe above for the PA program managers. However, we would also ask them about the high-level lessons learned from their 2014 trade ally research which we mentioned above.

  Our interviews with the EFI field representatives would focus on their outreach efforts. The topics we plan to cover would include how they contact HVAC distributors and manufacturers, how frequently the interact with them, sales pitches they use to promote the program, questions or concerns the distributors and manufacturers have about the program, barriers to program participation, and what could be done to streamline the process for getting more HVAC distributors on board.

- *Review of recent HVAC-related Massachusetts research:* We would review recent research which has been done on the Massachusetts C&I HVAC market under both the C&I and Cross-Cutting contracts with a special focus on market structure and market barriers.

Task 3: Best Practices/Benchmarking Study

The research task will allow us to learn about program designs and best practices for upstream HVAC programs from outside of Massachusetts. It will include the following activities:

- *Literature review:* We will conduct secondary research to identify other upstream/midstream HVAC programs offered in the market. This literature review will first compare key attributes of these non-Massachusetts programs with the Massachusetts program such as the type of equipment types they rebate and the size of the rebates they offer. In addition to benchmarking these program design features, we will also look for indicators of programs success such as participation levels, energy savings normalized by market size, higher benefit/cost ratios, and positive evaluation findings. We will summarize this research in a memorandum of key findings. From this research we will also identify up to five program managers of non-Massachusetts HVAC upstream/midstream programs to interview.
- *In-depth interviews with non-MA upstream HVAC program managers:* We plan to complete in-depth interviews with up to five program managers of non-Massachusetts HVAC upstream/midstream programs. While ideally these interviews should be limited to successful programs based on criteria mentioned above, we believe that interviews with managers of less successful programs can also produce useful information in the form of lessons learned and mistakes to avoid. Topics covered in these interviews could include: program design (e.g., HVAC products rebated, rebate levels, market actor eligibility requirements); marketing, outreach, and education and training activities; paperwork requirements; barriers to participation; lessons learned, and; programmatic elements that are particularly effective. In the 2014 and 2015 discussions with EEAC and PA representatives there was interest in learning more about California's Upstream HVAC Program specifically which has apparently had some success.

The deliverables for this research task will be the interview guide for the non-Massachusetts program managers and an interim findings memorandum.

Task 4: Market Penetration/Potential Analysis

This research task will help provide the PA representatives and EEAC consultants with an understanding of the C&I Upstream HVAC/HP Program's current impact on the market and its future potential. It will include the following activities:

- *Program activity and trends:* We will use program tracking data to analyze trends in the type of HVAC equipment being rebated and which distributors/contractors are selling this equipment. We will work closely with EFI which is responsible for compiling the program data.
- *Market penetration/potential:* To better understand the program's market penetration/potential, we would mine data from the ongoing Massachusetts Existing Building Market Characterization Onsite Study (P41/P50). Specific types of data that may be useful include:

- *Energy efficiency:* The evaluators have been using nameplate information collected onsite to estimate the energy efficiency of the installed equipment.
- *Whether the EE equipment received a program rebate:* For equipment which was reportedly installed in 2009 or later, the onsite engineers asked whether the installed equipment had received a program rebate.
- *Year of installation:* The evaluators asked the onsite customer representatives to estimate when HVAC equipment was installed.
- *Year of manufacture:* In addition to providing information needed for the determination of energy efficiency, the nameplate information on the HVAC equipment can also provide information on the date the equipment was manufactured. It is our understanding that the evaluators did not collect this information for Wave 1 of the P41/P50 project but they could do so for Wave 2 (and they could go back to the Wave 1 data to collect this, if needed).

Each of these data sources has their limitations. For example, the evaluation engineers did not always collect information on whether the HVAC equipment received a program rebate or the year of installation. This is because sometimes the onsite customer contact was unavailable to talk or had not been working there when the equipment had been installed. Even when the onsite contact was available to provide an estimate of installation date, they often provided a range of dates rather than a precise year.

As another example, the manufacturer year is not available in all nameplate information and, in many cases, we will have ranges of dates for when a given model was in production rather than a precise year. Furthermore, even when a precise year is available, there will inevitably be some unknown amount of time between when the equipment was manufactured and when it was installed. For these reasons, we will likely do a cross comparison of the reported year of installation and the manufacture date from the nameplate for the same pieces of equipment to see how well correlated these different information sources are.

Taking all these limitations of the data into account, this data mining should produce some useful indicators of program penetration and potential including:

- The proportion of program-eligible HVAC equipment which received a program rebate;
- The proportion of recently-installed HVAC equipment which was
  - Program eligible;
  - Energy efficient; and
  - Received a program rebate; and
- The proportion of HVAC equipment which is past its Estimated Useful Life (EUL).

We will choose which of these metrics to focus on after discussion with EEAC consultants and PA representatives. To the degree possible (e.g., the sample sizes remaining large enough to be meaningful), we will also look for any variations in these indicators depending on industry sector or building type.

The deliverables for this research task will include a brief memo summarizing the feasibility and pro/cons of these metrics (for stakeholder discussion) and an interim findings memorandum.

Task 5: Interviews with Participating and Nonparticipating HVAC Manufacturers and Distributors

The PA representatives and EEAC consultants are interested in knowing: 1) why HVAC distributors and manufacturers are not participating in the program; and 2) why HVAC distributors and manufacturers who are officially program participants are not more actively promoting the upstream incentives.

We plan to conduct in-depth interviews with 10 participating HVAC distributors, 10 nonparticipating HVAC distributors, and five HVAC manufacturers. These interview targets may change once we become more familiar with the participant population. For example, the current (October 2015) list of participating HVAC distributors has only 18 unique companies but the largest of these companies has 25 different locations. So if all equipment purchase decisions are made at the corporate level rather than at the location level, it will be challenging to hit our target of 10 completed interviews. But if we find that there is some autonomy in purchasing decisions among the local offices, then our sample frame will expand significantly.

The topics that we plan to cover with the participating distributors/manufacturers include:

- How they first found out about the program;
- Their motivation for joining the program;
- Their self-reported level of program activity;
- Barriers to increased program activity;
- How they use program rebates in their sales process;
- How they keep track of program changes (both actual methods and preferred methods);
- Their perspective on the mix of EE measures rebated by the program;
- Their perspective on the level of rebates offered by the program;
- Program satisfaction (with program staff, paperwork, rebate processing, marketing, program overall, etc.);
- Suggestions for program improvement; and
- Firmographic information (company size, service area, equipment/service offerings, market focus).

The topics that we plan to cover with the nonparticipating distributors/manufacturers include whether they are aware of the program, their barriers to program participation, their perspective on the mix of EE measures rebated by the program (once these have been described to them), their perspective on the level of rebates offered by the program (once these have been described to them), their suggestions for ways that the program could increase participation levels, and their firmographic information.

We will be careful to coordinate these data collection efforts with the Cross-Cutting research team working on the HVAC panel study. To develop our sample frame, we will not only use the program tracking data from Task 4 but will also leverage information collected from the recent Massachusetts Characterization of Supply Side Populations study as well as market sales information from the HVAC panel study.

The deliverables for this research task will be a sampling plan and the trade ally interview guide.

Task 6: Reporting

The deliverables for this evaluation will include:

- A memorandum summarizing the interim findings from the best practices/benchmarking study;
- A memorandum summarizing the interim findings from the market penetration analysis; and

A written report which will summarize the key findings from all the research activities and recommendations on how the C&I Upstream HVAC/HP Program can increase participation and improve its operational efficiency. The format of this report will be consistent with other DNV GL reports.

Potential Budget: $138,000

Study Name: CHP Process Evaluation
Research Area: Commercial & Industrial
Type of Study: Process Evaluation
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

CHP projects in Massachusetts have demonstrated significant C&I energy savings. They have also been used selectively for relieving T&D constraints. There are indications that more benefits from increased CHP usage could be realized if certain market barriers could be overcome. This study would identify the key barriers which discourage broader implementation of CHP projects, explore how these barriers might be mitigated, and discuss how CHP projects might produce other benefits (e.g. relieving T&D congestion) besides energy savings. Among the barriers to be examined include the following:

- CHP technologies have important but-difficult-to monetize benefits (e.g., to the T&D system; to utility business models and to host sites).
- CHP systems have an unproven ability to provide firming on an as-needed basis, which will gain in importance with increased penetration of intermittent resources or to help relieve “weak” spots in the distribution system.
- Many potential users are unaware of CHP performance aspects and their potential benefits which has limited broader use of CHP.
- There is a misperception that CHP systems are inherently high emission sources of NOx and cannot help with GHG emission reductions, which impedes their broader use even though natural gas prices are forecasted to remain low for the foreseeable future.
- There are misunderstandings on how best to incorporate CHP systems to help support the utility business models now and in the future.
- CHP systems have helped microgrids increase resiliency of T&D systems yet it is not clear to utilities the best way in which to use CHP systems to help improve system reliability and responsiveness.
- Utilities are concerned that increased levels of CHP will lead to more complex interconnection requirements for utilities.

One research objective is to provide suggestions on how CHP projects could be implemented more efficiently and effectively. In particular, this study will investigate approaches utilities are adopting to help streamline interconnection of CHP systems. In addition, this study will examine cases where CHP systems are being used within the grid to help provide firming of intermittent renewables as well as help improve system reliability and responsiveness.

Another critical research objective of this study is to identify factors that make certain utility customers good candidates for hosting CHP systems. For example, customers most likely to benefit from CHP systems are those with high thermal energy loads throughout the year, which have matching coincidental electrical loads or companies that may be expanding operations that will result in higher thermal and electrical loads. Other factors that may help certain customers be better candidates for hosting CHP systems include existing familiarity with mechanical systems, staff trained to support mechanical and electrical systems and a business approach and model that can incorporate more complex operations.

This study will also follow up on past CHP impact evaluation work that examined different methodologies used by Massachusetts utilities in estimating potential energy savings of CHP projects. The specific research objective is to determine if the utilities have adopted a more common methodology for estimating energy savings recommended in the past study. If a common methodology has not been adopted, this study will assess the barriers to adoption of a common methodology.

High-Level Description of Approach/Methodology:

Task 1: Work Plan Development

The DNV GL team will work with the PAs and EEAC Consultants to develop a work plan, budget and project schedule to achieve the outlined research objectives.

Knowledge gained from a 2011 Massachusetts CHP Market Characterization[19] and two Massachusetts CHP Impact Evaluations (one in 2012[20] and one in 2013[21]) will inform the research of this study and help establish the approach.

In addition, Itron is currently involved in a distributed energy resources market transformation study that encompasses CHP technologies being deployed in states across the country. Information gleaned from that ongoing effort will also help guide this research study.

Task 2: Establish Survey Designs and Sample Design

We will collect data on CHP barriers and possible barrier resolution from four sources: CHP system manufacturers and project installers; utility program administrators; utility distribution planners; and program participants and non-participants. Data collected from the earlier CHP market characterization study and existing literature research will help in developing draft survey instruments for each of the target groups and in developing sample population estimates.

The surveys will focus on obtaining a better understanding of how the different groups approached CHP projects; who was involved in development of the project; what were the different goals of the project; what were the expected benefits; what were the types of barriers (e.g., technical, economic, financial, institutional, etc.,) encountered from project concept through project installation and operation; lessons learned along the way and opinions about what changes are needed to help ensure successful adoption of CHP in Massachusetts. Examples of specific questions to be included in the surveys include the following:

- Where did the idea for this CHP project come about?
- What were the objectives of this project (just energy savings, T&D relief also)?
- Who was involved in the technical design and scope of the project?
- Was adequate technical assistance readily available?
- How was the project financed? What were the paperwork requirements for this project and were they reasonable?
- How long did the project take to implement?
- What stages of the project took longer and how could these stages be streamlined?

We will submit draft survey instruments to the PAs and EEAC and finalize them based on PA and EEAC feedback.

---

[19] "Project 1C Combined Heat & Power Market Characterization," prepared for Massachusetts Energy Efficiency Program Administrators, KEMA Inc.; Itron; Energy & Resource Solutions, June 1, 2011

[20] "2010 Combined Heat and Power Impact Evaluation Methodology and Analysis Memo," prepared for Massachusetts Energy Efficiency Program Administrators and the Massachusetts Energy Efficiency Advisory Council, KEMA Inc.; Itron; Energy & Resource Solutions, January 11, 2012

[21] "Massachusetts Combined Heat and Power Program Impact Evaluation: 2011-2012," prepared for Massachusetts Energy Efficiency Program Administrators and the Massachusetts Energy Efficiency Advisory Council, KEMA Inc. and Itron; November 2013

Task 3: Data Collection

Using approved survey instruments, the team will collect primary information on how these CHP projects are typically implemented and which barriers complicate project implementation and limit more widespread adoption of CHP in Massachusetts. We expect to conduct five in-depth surveys with program administrators and up to thirty in-depth surveys with CHP project installers and CHP manufacturers active in Massachusetts to identify specific market or institutional barriers confronting CHP adoption in the state. Particular emphasis will be placed on identifying methods by which barriers can be addressed through near-term activities. Similarly, we anticipate conducting five in-depth surveys with utility distribution planners to identify operational issues that might arise due to increased CHP growth in the distribution system, limits associated with current methods for incorporating CHP systems into the system, and if CHP growth in the distribution system is to occur, ways in which that growth could result in benefits to customers and the utility.

A combination of up to seventy telephone and internet surveys will be conducted with participants to determine the origin of the CHP project, to identify reasons why participants elected to install CHP systems, specific objectives of the CHP project (including those beyond just energy savings), the way in which the project was financed, the paperwork and permit requirements of the project, the length of time it took to install the project, what benefits or issues resulted from installation of the systems, what unanticipated benefits resulted, lessons learned about CHP performance and costs and what considerations should be given to growing CHP in Massachusetts. In addition, participants will be asked to identify what messaging, information, source of information and outreach method most influenced their decision to move forward with the project. The collected information will help identify characteristics of participants that may be better candidates for targeting CHP outreach efforts.

Similarly, telephone and internet surveys will be conducted with approximately 200-300 non-participants (i.e., utility customers who were targets of the CHP program offering through utility outreach or who may have applied to the CHP program but then elected not to participated in the program) to identify reasons why they chose not to pursue CHP systems; the extent they were or are knowledgeable about CHP performance and costs; the extent to which market versus institutional barriers acted as decision points for them; and what factors may have induced them to install CHP systems (but were not present at the time they were making their decision).

Depending on the results from the surveys, the team will also consider holding several focus group meetings among a combination of project installers, program administrators, participants and non-participants to discuss the primary barriers facing increased adoption of CHP systems and possible resolution to those identified barriers.

Task 4: Reporting

The team will provide a draft and final report which will contain key finding from our research as well as recommendations on ways in which to incorporate the findings into action items for the CHP program.

Potential Budget: $125,000 - $200,000

Study Name: How PA Differences Affect Program Outcomes, Phase 3
Research Area: Commercial & Industrial
Type of Study: Process
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

Overall, this project seeks to identify the factors that lead to differences in the depth and cost of savings among the PAs. This project is intended to provide information and insights that will be useful for the PAs and contractors to identify best practices. All stakeholders agreed to time this project so it can leverage the data from the 2014 Customer Profile report (Project 51). Discussions with stakeholders about the outstanding questions from Phase 2 identified the following activities and/or researchable topics of most interest to the PAs and EEAC Consultants:

- How saturated are the large customers in the various PA territories? Is there a relationship between saturation and freeridership? What strategies could PAs with more saturation employ to increase attributable savings? Integrate with the technical potential studies PAs produced for new Three Year Plan and DNV GL's Onsite Assessments study (Project 41).
- Define or update the definition of mid-sized customers, particularly for gas. What are the differences in services, measures, and savings with mid-sized customers? What are the commonalities and unique aspects of this market segment across the state? Expand on the Mid-sized Customer Needs study from 2013.
- Investigate approaches/successes within specific market segments, contrasting and comparing unique strategies for targeting and affecting specific market segments across the PAs. For instance, the PAs have multiple ways of serving grocery.
- How could the PAs achieve greater savings from office and retail buildings (customer types that have potential savings that are expensive to achieve)? What are the different characteristics (e.g. size) and savings potential of office and retail customers by PA? What strategies could PAs employ to increase savings in these sectors? How does National Grid compare to Eversource after restructuring?
- Conduct a longitudinal analysis of HVAC savings. Specific questions include, but are not limited to: Is Eversource still achieving better HVAC savings than National Grid? Does National Grid's new organization improve its achievement of HVAC savings?
- Provide a focused, longitudinal comparison of the PAs' New Construction programs, similar to the Large Retrofit comparison conducted in Phase 2.

High-Level Description of Approach/Methodology:

<u>Task 1: Work Plan Development</u>

The first step in this evaluation will be to develop and agree upon a work plan. In addition to scope, budget, and timeline, key activities during this stage are to articulate and prioritize precise researchable questions, establish definitions of key concepts, and determine data sources that will be necessary to address the researchable questions. Other important activities during this stage are to identify content overlap with other ongoing evaluation efforts and decide which project will include that content. It is possible this could result in moving of some of the topics listed above from the final scope of this project to another project. This project is dependent on the data from Project 51, so finalization of the Project 51 scope of work is required before finalizing this project's work plan.

<u>Task 2: Data Collection</u>

The exact data sources used for the project will depend on the final scope articulated in Task 1. DNV GL anticipates using the following data sources: the database constructed by DNV GL for Project 51, Project 41 on-site survey results, and the technical potential studies produced by the PAs for the 2016-2018 Three Year Plan. The scope will probably require additional in-depth interviews with PA staff, other program stakeholders, subcontractors, and customers to help focus and add depth to the quantitative analyses.

Task 3: Analysis

Conduct analyses to answer the specific researchable questions articulated in the scope of work.

Task 4: Reporting

The team will provide the PAs with a written report containing the analysis results. Reporting will be consistent with the MA CIEC Contract Management guidelines currently under development. Based on past experience with Phase 2 and similar reports, DNV GL anticipates a vigorous report revision process between the draft and final report.

Potential Budget: $350,000 - $450,000

5.3 CROSS-CUTTING STAGE 1 WORK PLANS

Study Name:	Stretch Code Market Effects (TXC 3)
Research Area:	Cross-Cutting
Type of Study:	Market Effects
Applicable Fuel(s):	Electric & Gas

Overall Study Goal:

The primary goal for this study will be to assess whether or not the trainings sponsored by the Massachusetts Program Administrators (PAs) have influenced changes in practices among market actors in stretch code cities and towns. Beginning in 2010, Massachusetts municipalities began adopting the stretch energy code[22], which is one of the requirements to become a green community under the Green Communities Act[23]. As part of the Code Compliance Support Initiative (CCSI), the PAs are conducting trainings with various market actors (e.g., builders, code officials, and HERS raters) to enhance compliance with the stretch code.

A secondary goal of this study will be to begin developing a comprehensive set of stretch code data that can be used to inform a Delphi panel and aid in the assessment of attribution of savings in stretch code municipalities to PA efforts. In addition to attribution from the CCSI trainings, the PAs may be responsible for compliance enhancement through a number of indirect factors. These indirect factors may include the following:

- Initial support and contributions to the Massachusetts Department of Energy Resources (DOER) in their development and adoption of the stretch code
- The development of a robust HERS rater market in Massachusetts through the Residential New Construction (RNC) program
- Training and information sessions held in communities considering adoption of the stretch code by the RNC Program
- Spillover from stretch code municipalities into non-stretch code municipalities due to a change in practice from market actors that work in both segments of the market.

Research Questions:

- Are the CCSI trainings influencing changes in practices for key market actors in stretch code municipalities?
- What comprehensive stretch code data can be gathered and used to assist a future Delphi panel?
- What are the indirect effects of the stretch codes and what can be attributed to the CCSI trainings?

Note that this Delphi study will serve other purposes as well, as discussed in the broader strategic approach to evaluating codes and standards activities.

High-Level Description of Approach/Methodology:

---

[22] Stretch Code Provisions
[23] How to Become a Green Community

As part of the ongoing CCSI evaluation, the evaluation team is conducting follow-up surveys with various market actors to assess whether or not the trainings have influenced their practices. The work suggested here, which is not included in the already approved work, is to investigate the responses from stretch code communities in particular to identify what type of influence the CCSI has had on trainee practices.

An additional task that can added to a future Delphi study is to begin documenting stretch code data to help inform the assessment of PA attribution in stretch code communities and from any stretch code spillover. Specifically, the evaluation team will review data from stretch code towns that were included in the 2011 Single-Family Baseline study and compare it to the data from stretch code towns that are currently being included in the ongoing Single-Family Compliance/Baseline study. Stretch code towns that were in the 2011 baseline study had not yet begun enforcing the stretch code and therefore will offer a pre-stretch code baseline that can be compared to results from the current study to inform the Delphi panel's assessment of attribution. In addition to compiling these data, the evaluation team will begin compiling detailed documentation of any PA efforts that went into developing the stretch code and participation of market actors from stretch code communities in initial trainings that took place prior to the implementation of the CCSI.

Potential Budget: $130,000 - $185,000

Study Name: Commercial & Industrial Top-down Modeling Exploration of Key Econometric Concerns (TXC 22)
Research Area: Cross-Cutting
Type of Study: Impact (Commercial & Industrial)
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to further investigate key econometric concerns identified through the Year 1 top-down modeling method review and PA-muni and PA-data pilot studies.

Research Questions:

The general research question addressed by this project is how best to specify, test, and apply the models. Specific questions include:

- What is the best approach for handling weather variation (weather-normalized annual data vs. weather terms in the econometric model)?
- How should models account for cumulative program effects of programmatic activity over time--.i.e., whether to use cumulative lagged terms, individual lagged terms, or indexed lagged terms?
- What is the most appropriate method for constructing portfolio-level savings estimates and error bounds from the model results?
- How should models account for the recession years (2008-2010) to determine impacts on energy usage?

High-Level Description of Approach/Methodology:

Phase 1 of this work will expand on the literature review conducted for the 2015 top-down efforts to examine best practices in evaluation using aggregate econometric analysis for non-energy federal programs. Also included will be a discussion of theoretical advantages and disadvantages of particular methods. If the PAs elect to continue with the second phase, we will apply the techniques identified through Phase 1 to the models developed through the Year 1 top-down pilot studies.

The specific tasks for Phase 1 of this study include the following:

<u>Task 1: Develop the work plan</u>

The evaluation team will develop a detailed work plan for the study.

<u>Task 2: Extended methods assessment: Literature review, in-depth interviews, and theoretical assessment</u>

The evaluation team will build on the 2015 methods review by examining literature regarding other federal programs that employ top-down modeling to assess programmatic impacts, as well as academic literature concerning the appropriate treatment of the relevant econometric concerns. We will conduct five to ten interviews with academics, public officials, or other individuals regarding the relevant econometric concerns. We will also develop some primary assessments of pros and cons from a theoretical perspective.

Task 3: Reporting

The evaluation team will prepare a draft and final report consolidating the findings from Task 2 together with the prior MA Top-Down studies into recommended approaches and guidance for top-down model development.

Potential Budget: $47,000 - $63,500

Study Name: Top-Down—Exploring Enhancements to the PA-Muni Model (TXC 23)
Research Area: Cross-Cutting
Type of Study: Impact
Applicable Fuel(s): Electric and Gas

Overall Study Goal:

A major limitation of the PA-Muni top-down modeling conducted previously is that much of the programmatic activity is consistent across the PA territories, as are the socioeconomic characteristics. This limits the amount of variation within and across observational units. Adding another year of data from MA, including if at all possible more detailed geographic breakdowns, could provide additional variation to the models. In addition, it may be possible to develop gas models as well as electric models if town-level data are available.

This study will first explore whether these additional data are available and whether the approach appears promising, and, if so, would develop additional models making use of those data. Although the PAs have indicated that town-level data are not available, it will be beneficial to explore if there are any useful geographic-based aggregate consumption and program data that might be available for an extended historic period, even for a subset of the PAs.

Research Question:

The study seeks to obtain data with greater variation across time and across municipal utilities and PAs, and if possible to develop more robust Top-Down PA-Muni electric models, both residential and commercial/industrial, and possibly for natural gas as well.

High-Level Description of Approach/Methodology:

The previous models utilized data from 1990 through 2012. However, the municipal utility association supplied data through 2013 for most municipal electric utilities. In the first, exploratory phase, this new study will seek usage and program expenditure data for 2013 from the electric PAs in Massachusetts. Also in the exploratory phase, the evaluation team will explore with the MA PAs whether any within-PA geographic breakdown of electric usage and program expenditure data are or could be available, and if so for what years. In addition, the evaluation team will explore whether similar usage and expenditure data are or could be available from the gas PAs, and if so for what years. Before requesting the data for natural gas, however, the evaluation team will examine the likelihood of success based on the average percentage of savings per household and the range of variation in program activity level over time for gas versus electricity.

If the data are available and the approach appears feasible, the evaluation team will develop additional models. These models could include residential and commercial electric PA-muni models with 2013 data included, town-by-town residential and commercial PA-muni electric models, and/or town-by-town gas PA models.

Potential Budget:

The potential budget range for the exploratory phase of this project is $45,000 to $65,000. The modeling phase, should it occur, would involve the development of two or several models, and will have a budget range of $150,000 to $320,000.

Study Name: Commercial & Industrial PA-Data Top-Down Modeling Refinements (TXC 25)
Research Area: Cross-Cutting
Type of Study: Impact (Commercial & Industrial)
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The goal of this study is to expand the C&I top-down modeling database created in the 2015 C&I PA Top-down Modeling study to include more years of data and to then re-estimate the C&I PA Top-down model. The evaluation team will continue to compile additional years of billing and tracking data as they become available through the C&I Customer Profile Database. Re-estimating the C&I models is not included in the study plan. The team will determine the timing for re-estimating the models when sufficient long-term data are available.

High-Level Description of Approach/Methodology:

Task 1: Develop the work plan

The evaluation team will develop a detailed work plan for the study. The work plan will build upon the data collection activities used in the 2015 C&I PA-data Top-Down Modeling study.

Task 2: Compile C&I Customer Billing and Program Tracking Data

The evaluation team will extract and compile additional customer billing and tracking data from the C&I Customer Profile Data Base. The data will be appended to the database used for the 2015 study.

Task 3: Compile Other Input Data

The evaluation team will compile and process other economic and firmographic data. These data will also be appended to the 2015 top-down data base.

Task 4: Determine Timeline for TDM C&I Model Updates

The evaluation team will work with the PAs and EEAC consultants to determine the requirements for length of time series needed for re-estimation of the PA-data model.

Deliverable:

Task 3 – Expanded C&I PA-data SAS data base.

Potential Budget: $42,000 - $58,500

Study Name: Market-Rate Rental Property NEIs (TXC 29)
Research Area: Cross-Cutting
Type of Study: Impact
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The Market-Rate Rental Property NEIs study will examine and quantify non-energy impacts (NEIs) for the owners and managers of market-rate rental properties. NEIs can be an important driver of and outcome to energy efficiency programs and market decisions. In 2011, a NEI study sponsored by the Massachusetts Program Administrators (PAs) estimated NEIs that accrue to owners and managers of low-income rental properties. However, the study did not include owners and managers of market-rate rental properties. NEIs for this market segment include, but are not limited to, changes in monthly apartment rental rates, operations and maintenance savings, and reduced vacancy rates.

In order to estimate these NEIs, we recommend adapting the methods used by DNV GL in the C&I NEI study[24]. Through interviews with owners and managers of rental properties, the evaluation team will estimate a number of NEIs that may result from the installation of energy efficiency measures and if possible quantify their value.

Research Questions:

- What are the NEIs experienced by the owners and managers of market-rate rental properties?
- How can the NEIs be quantified and how do they compare to energy impacts?
- Are some measure categories, such as lighting or heating equipment, associated with higher NEI values than other measure categories?
- How do NEIs relate to energy efficiency purchases or decisions in the market-rate rental segment? Are they anticipated prior to decision making or emerge after projects are implemented?
- How might NEIs affect program design or market engagement options?

High-Level Description of Approach/Methodology:

Through interviews with owners and managers of rental properties, the evaluation team will estimate a number of NEIs that may result from the installation of energy efficiency measures. The interviewer will use closed-ended questions to determine whether the rental property experienced the NEIs and then open-ended questions to quantify NEI values. The interview guide will be designed to allow the interviewers to probe deeply into potential sources of NEIs and allow owners and managers to estimate NEIs in metrics with which they are familiar. For example, NEI values can be estimated as hours of labor saved from fewer light bulb changes or hours of labor saved due to fewer tenant complaints, resulting in wage savings. They can also be estimated in terms of increased monthly rental rates, or reductions in vacant apartment units. These data will be used to quantify the NEIs into

[24] Massachusetts C&I NEI Final Report (2012)

dollar values (i.e., hours of reduced labor multiplied by the hourly wage rate). These data will allow the evaluation team to develop a set of monetized NEI estimates for each owner or manager.

Potential Budget:

We have developed three budget scenarios. The budget scenarios are largely determined by the number of measure categories, such as lighting, heating and cooling equipment, shell measures (e.g., insulation and air sealing), and hot water measures addressed by the study. Each interview will address a minimum of two measure categories and we will target 30 to 50 completed interviews for each measure category. We will prioritize measure categories by the magnitude of expected energy savings. The low-, medium- and high-budget scenarios will attempt to estimate NEI values for two, three and four measure categories, respectively. The three research options and costs are summarized in the following table.

Tasks	Budget range
Low	
Task 1: 50 in-depth interviews	$150,000 - $180,000
Task 2: NEI estimates for two measure categories	
Task 3: Final report	
Medium	
Task 1: 75 in-depth interviews	$175,000 - $215,000
Task 2: NEI estimates for three measure categories	
Task 3: Final report	
High	
Task 1: 100 in-depth interviews	$210,000 - $260,000
Task 2: NEI estimates for four measure categories	
Task 3: Final report	

Study Name:	Net-to-Gross Methodology Research
Research Area:	Cross-Cutting
Type of Study:	Impact (Commercial & Residential)
Applicable Fuel(s):	Electric & Gas

Overall Study Goal:

The goal of this study is to examine the general methods used in Massachusetts (MA) for estimating free-ridership and spillover, comparing current methods in MA to those used in other regions of the US. The study will also investigate and document the strengths and weaknesses of conducting net-to-gross (NTG) studies at different levels of measure, program, customer, and/or other level of aggregation. Additionally, the study will investigate NTG practices related to the time delay between project inception, completion, and NTG data collection. A report will provide options, trade-offs, and recommendations for modifications to the existing approaches for consideration by the Massachusetts PAs.

This study will continue to build on the methodological reviews that have been done for the PAs. In 2011 a pair of detailed studies developed suggestions for more standardized guidelines for quantifying net savings for commercial and industrial programs (Tetra Tech et al. 2011) and for residential programs (NMR 2011). Since then, the cross-cutting research area has conducted four NTG surveys (two electric and two gas) with C&I downstream participants—electric C&I studies conducted in 2011 and 2014 and gas C&I studies in 2012 and 2014-2015. In addition, one cross-cutting study identified possible overlap among various NTG estimates for non-residential new construction (NMR 2015); such overlap should be taken into account for other programs and markets as well.

Research Questions:

- What new techniques are being utilized to assess NTG and which can be incorporated into the existing NTG studies?
- What are relative advantages and disadvantages of the various new and existing methods for different program types and conditions, and for different NTG-related questions?
- What are key program, definition, and methodological differences that contribute to differences in measured NTG results?
- What customer segments drive NTG ratios?
- What are the implications of different levels of aggregation when conducting studies and calculating NTG ratios?
- What are the benefits and challenges of conducting customer survey-based NTG studies soon after customer participation on a more “real-time” basis?
- What are alternative approaches and methods for understanding spillover?
- What are effective ways to coordinate market effects studies with NTG efforts?
- Can the consistency question battery in the current MA NTG surveys be simplified to reduce respondent burden?
- What methods are available to properly account for net savings when multiple programs affect a single set of decisions in regard to implementing energy efficiency measures? Examples of this include interactions between residential retrofit incentive and home energy report programs and between new construction incentive and code enhancement/enforcement efforts.

- What methods are available for deciding how to select and/or combine the results of alternative methods applied to estimate net savings for the same program?

High-Level Description of Approach/Methodology:

Task 1: Develop the research plan

The evaluation team will develop a detailed research plan for the study. The research activities are likely to include the following:

- Best practice and literature review to examine techniques currently being used to measure NTG and possible sources of overlap
- Review existing cross-cutting reports to identify impacts of market effects on NTG
- Analyze existing NTG results from the prior four studies (gas and electric) to identify potential drivers (e.g., organizations guidelines for purchasing equipment)
- Interviews with PA program and evaluation staff.

Note also that the potential list of research questions is quite extensive, and the actual research may instead focus more deeply on a subset of the issues listed above.

Task 2: Conduct the activities and analysis

The evaluation team will conduct the activities and analysis specified in the research plan. The team will conduct an internal review of the findings and consider their implications for current MA NTG practices and effects on NTG ratios.

Task 3: Produce a draft and final report

The Evaluation team will develop a report based on the findings from Task 2.

Additional activities could include pretesting new approaches or question wording once best practices and approach recommendations have been identified and agreed upon.

Deliverable:

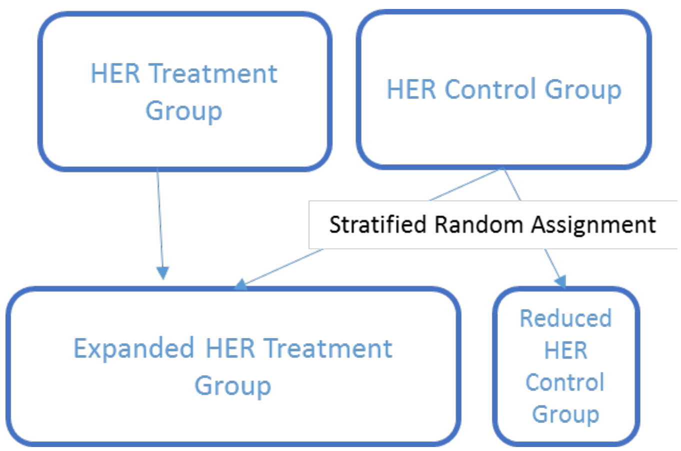
Task 3 – Draft and final report. This report will document the studies and reports reviewed for the analysis and recommend an approach for the PAs to consider.

Potential Budget: $130,000 - $185,000

Study Name: Reducing the Size of the Control Group in the Home Energy Report Program
Research Area: Cross-Cutting
Type of Study: Impact and Process
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

Approximately 400,000 Massachusetts households are ineligible to receive Home Energy Reports (HER) because they have been randomly assigned to the control group. The goal of this study is to assess the opportunity for transitioning existing control group customers into the treatment group as depicted in the figure below.



High-Level Description of Approach/Methodology:

Task 1: Power Analysis of Existing HER Cohorts

Using the savings estimates developed in the 2014 evaluation, the team will conduct a power analysis to determine the largest ratio of treatment-to-control customers while maintaining the desired level of confidence and precision. The level at which the power analysis will be conducted will be determined by the PAs, EEAC, and the Navigant team (e.g., cohort, PA and fuel-type). Additional studies expected to be implemented in the near term (e.g., combined behavior and Wi-Fi thermostat program, persistence study) will be factored into the analysis. This analysis will result in the number of control customers that can be transitioned into the control group. Average savings per household are expected to remain stable due to the RCT-design.

Task 2: Develop a Transition Protocol

The team will work with the Implementation Contractor to develop a protocol for transitioning customers from the control group to the treatment group, while maintaining randomization.

Task 3: Implement Transition Protocol

The team will implement the transition protocol, re-assigning customers from the control group to the treatment group and validating that randomization has been maintained. The team will use the results of Task 1 to inform how many control customers should be transitioned.

Task 4: Analysis and Reporting

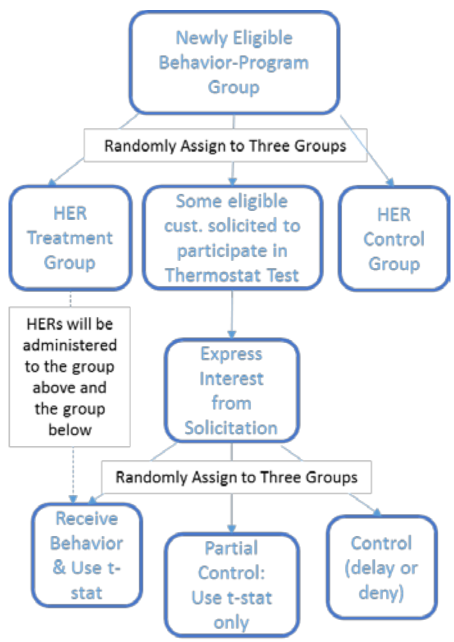
The team will provide the PAs with a written report containing the results of the Power Analysis, the Transition Protocol, and a summary of implementation of the Transition Protocol.

Potential Budget: $40,000 - $75,000

Study Name: Assessment of Combined Behavior and Wi-Fi Thermostat Programs
Research Area: Cross-Cutting
Type of Study: Impact and Process
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The PAs are interested in assessing combination behavior and technology through Wi-Fi thermostat technology. Through careful experimental design--including the development of a control group who receive Wi-Fi thermostats without behavioral messaging--this study will estimate savings associated with Home Energy Reports (HER) only, Wi-Fi Thermostats only, and HERS + Wi-Fi. To test a wide variety of thermostats, and to reduce costs, this effort will be implemented using a "bring your thermostat" model that has been adopted by organizations like Energy Trust of Oregon and Southern California Edison. The thermostat model(s) will be chosen in consultation with the PAs and EEAC. The figure below contains the preliminary study design. As explained in the next Stage 1 plan, *Leverage Wi-Fi Thermostat Data in other Residential Evaluations*, another important benefit if this study is that the control groups can be used to evaluate impacts of Wi-Fi thermostats as an individual measure offered within Home Energy Services and other residential programs. Given this cross-over to Residential programs, the PAs may employ a budget sharing mechanism to allocate funding to the Cross-Cutting and Residential sectors.



High-Level Description of Approach/Methodology:

Task 1: Literature Review

As a first step, our team will perform a literature review for current and past research conducted on integrating Wi-Fi thermostats with behavioral interventions with a specific focus on the integration challenges, advantages, fielding strategies, and savings impacts.

Task 2. Design Experiment and Identify Participant and Control Groups

The team will develop an experimental design that crosses PA's using a recruit and delay/deny method (see the supplemental diagram/model). A new HER-eligible group of customers will be identified to support this study.

Task 3. Planning Workshop with PAs, EEAC and HER and Residential Audit Program Implementers and on-going Coordination

A true field trial, this study will require close upfront coordination and planning with the MA PAs and the program implementation teams, including the HER program administrator and the residential audit teams. The Navigant team, PAs and EEAC will be present to develop a set of goals, which will include a requirement that the thermostat manufacturers and customers provide data to the PAs, as well as coordination and communication guidelines. We will also cover ways to support customers who purchase thermostats to ensure low attrition in thermostat purchase and installation.

Task 4. Recruit Customers to Participate

Customers who are eligible to participate in the study will be recruited using post card solicitations. All customers who are willing to participate will be screened for eligibility and then assigned to the various groups identified in the figure on the previous page.

Task 5: Monitor Experimental Validity

During fielding, we will carefully monitor the integrity of the experiment throughout the fielding process. Any issues that emerge will be documented and remedied through adjustments to the methodology or other field strategies.

Task 6: Surveys of Treatment Groups

The goal of this task is to conduct targeted in-depth interviews followed by surveys with all three treatment groups: HER only, Wi-Fi only and Wi-Fi/HER participants using email-based survey methods. Surveying all three groups will allow for a comparison across groups in their response to treatment. A key focus of the Wi-Fi/HER participant survey will be to understand the intersection of education and technology and customers' perceptions of their combined value.

Task 7: Impact and Process Analysis and Reporting

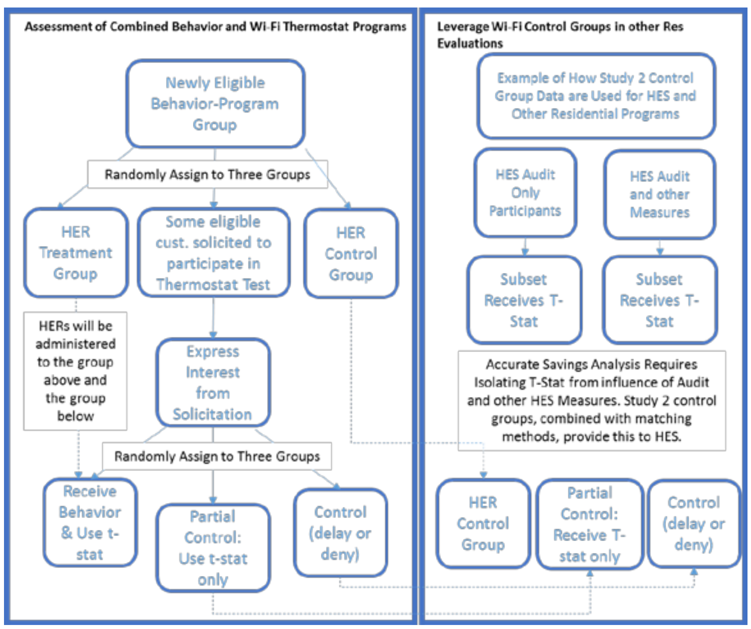
Using regression-based approaches, our team will conduct impact evaluations of the savings associated with each treatment condition, factoring in seasonal effects and other areas of interest, such as fuel source. We will also prepare a report on the qualitative findings. The team will provide the PAs with a written report containing the results of the impact and process findings as well as a summary and strategy guidance document for future integration efforts.

Potential Budget: $300,000 - $500,000

Study Name: Leverage Wi-Fi Thermostat Control Groups in other Residential Evaluations
Research Area: Cross-Cutting
Type of Study: Impact and Process
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The PAs are beginning to deploy Wi-Fi thermostats through the HES program, and are considering other delivery channels for Wi-Fi thermostats (e.g., low income). Impact evaluation of measures offered through these programs require a control group -- this study effectively uses the Wi-Fi only control group developed as part of the "Assessment of Combined Behavior and Wi-Fi Thermostat programs" study for other residential evaluations. This is shown in the figure below, where the control groups from that study (left panel) are used in this study (right panel). Given this cross-over to Residential programs, the PAs may employ a budget sharing mechanism to allocate funding to the Cross-Cutting and Residential sectors.



High-Level Description of Approach/Methodology:

Task 1: Data Repository

The team will build a data depository allowing the Residential team access to the billing data and thermostat data for the Wi-Fi Thermostat control group. Availability of this data will lead to more precise billing analysis estimates and smaller metering samples for all residential HVAC and envelope-related evaluations.

Task 2: Modeling the Energy Consumption and the Creation of Load Shapes of End-uses

The team will use the Wi-Fi Thermostat-only control group to model the energy consumption and create load shapes of specific end uses and measure savings, including CAC/HP/Furnace/Boiler, etc. The Wi-Fi thermostat data will make it possible to observe differences in HVAC load shapes between participants installing different HES measures, allowing for the development of improved savings load shapes, including for oil and propane.

Task 3: Analysis and Reporting

The team will provide the PAs with a written report describing the Data Repository, and the modeled end loads / load shapes. The load shapes will also be provided consistent with the requirements of the PAs existing load shape database.

Task 4: Ad Hoc Analysis Requests

This task would involve data queries and analyses as desired/necessary for evaluations. For example, suppose Wi-Fi thermostats are considered as an additional measure for the low income program. Through matching procedures, a subset of the HES and control households resembling low income households could be identified, along with estimated impacts. This is just one example; in practice, the idea is to set aside a task budget that would be available to the PAs/EEAC but would not be accessed without prior approval.

Potential Budget: $125,000 - $300,000

Study Name: Effectiveness of Community-Based Program Design Elements and Marketing Tactics
Research Area: Cross-Cutting
Type of Study: Process
Applicable Fuel(s): Electric & Gas

Overall Study Goals:

Massachusetts Program Administrators (PAs), as well as PAs across the country, have been relying on community-based programs (CBPs) to reach customer segments of interest, provide education, overcome specific barriers to measure adoption, drive participation, and achieve deeper savings. Interventions, program design elements, and marketing strategies and tactics of CBPs vary extensively, and so does the success of these program efforts. With the abundance of CBP implementation experiences, PAs lack understanding of the causal effects of the various design elements and marketing tactics on customer participation rates and resulting savings.

The goal of this study is to assess the relative effectiveness of 1) distinct design elements of CBPs, such as increased incentives, new measure (or measure bundles) offerings, and the availability of customer specific technical or administrative support (e.g. designated program concierges), etc. and 2) distinct marketing and messaging strategies and tactics on program participation and savings.

Below we outline an integrated research approach that combines the assessment of various CBP program design elements and marketing strategies and tactics into a single study[25].

The results from this study will inform future CBP designs by providing PAs with a toolkit of the most effective program elements and tactics.

Research Questions:

The following are the prioritized research questions that we will answer as part of the study:

- What are the most effective CBP design elements in driving participation and savings?
- What are the most effective marketing and messaging strategies and tactics in driving participation and savings?
- How does the effectiveness of program design elements and marketing and messaging tactics vary by target audience and geography?

High-Level Description of Approach/Methodology:

To answer the research questions specified above, we will draw on several research and analytical strategies.

We will complete an extensive literature review of the community-based programs in Massachusetts and across the country to understand the variety of design elements and marketing approaches used and assess their relative success. The literature review will include recent evaluation studies, white papers, conference proceedings, and other relevant publications. At the outset of the study, we will work with the Massachusetts PAs to arrive at a consensus regarding a comprehensive definition of a “community-based program” for purposes of scoping the breadth of our literature review.

We will supplement the literature review with expert feedback. We will complete a series of in-depth interviews with a range of stakeholders involved in planning and executing CBPs or who are otherwise knowledgeable in this

[25] They were posed as two separate research questions in the Summit proceedings.

area. The sample of stakeholders will include representatives from Massachusetts PAs, PAs from other jurisdictions, local and state governments (both in Massachusetts and in other parts of North America), non-profit, community, and other organizations involved in planning and implementing these programs. These interviews will not only provide a perspective on the effectiveness of different program elements, but will inform our understanding of any barriers that may stand in the way of deploying the winning program elements successfully. Moreover, we will leverage these interviews to characterize the goals of each program effort, the types and size of communities targeted by various programs, and the performance metrics for and goals of each the programmatic activities.

To quantitatively assess the effectiveness of the CBP elements, we will perform multi-level regression analysis of the past CBPs. To support the analysis, we will assemble a custom database with past CBPs deployed in Massachusetts. We will plan to go five years back and capture the programs implemented during this timeframe. For each program, we will record the geographic area the program covered, design elements it featured, marketing and outreach tactics it deployed, the times (in month-years) it was in effect, and program participation rates and savings for each area and time period. We will draw on program tracking databases, marketing tracking databases, and the interviews with Massachusetts PAs and other stakeholders to accurately record CBP details. If possible and feasible, we will leverage any primary data collection efforts (past and future) to capture attitudinal and other information and include it in the database and subsequent analysis. For example, we will leverage statewide umbrella marketing survey, Efficient Neighborhoods+® participant and non-participant surveys, and other efforts.

The final analysis dataset will contain one record for each program-tactic-census block group-time period combination. This means coding each design element and marketing or program effort by the geographic area in which it was deployed, and the time period within which it was deployed.

Multi-level modeling is an effective method to provide understanding about the relative effectiveness of the many program design elements and marketing tactics deployed both in terms of flexibility of analysis and error reduction. It is a regression technique that creates coefficients for multiple 'levels' of predictors, with 'levels' referring to variables at different levels of aggregation. The analysis will leverage multiple levels, including census block group during a calendar month, towns or municipalities, custom defined "communities" based on homogenous sociodemographic, housing, and other characteristics of its residents, PA territories, and state as a whole.

The outcome variables for this analysis would be participation rates and savings for any community-based program or a set of programs. The outcome variables would be 'predicted' or 'explained' by the program design elements and marketing tactics deployed. The modeling will estimate the effect of each program element and allow to compare the effects across all available elements. Comparison of effects can be performed at various geographic and temporal levels. The results of this analysis, combined with the other research activities described above will serve as inputs into the development of the toolkit of effective elements and practices to designing and implementing CBPs.

Potential Budget: $150,000 - $225,000

Study Name: 2015 Mass Save Statewide Campaign Post Campaign Study
Research Area: Cross-Cutting
Type of Study: Process
Applicable Fuel(s): Electric & Gas

Overall Study Goal:

The Opinion Dynamics Evaluation team recommends a post-campaign study of the 2015 Mass Save Statewide Campaign. The main objective of the study is to measure customer awareness and understanding of the Mass Save campaign and compare 2015 results to previous years. We will complete surveys with both residential and commercial and industrial (C&I) customers.

We provide two study options. The first option is similar to the post-campaign studies we have conducted in previous years and includes a review of marketing materials and a full written report of the study results. The second option is does not include a material review and presents the survey results as a slide deck and a top line rather than a written report.

Research Questions:

Specific research objectives include the following:

Options 1 and 2

- Explore brand awareness, knowledge and associations with Mass Save

Option 1 Only

- Assess content of marketing materials
- Assess effectiveness of campaign messaging
- Assess the influence of Mass Save marketing on participation in PA programs

High-Level Description of Approach/Methodology:

Task 1: In-Depth Interview with Marketing Staff (Options 1 and 2)

For both study options, the team will conduct check-in interviews with PA marketing staff, as well as representatives from the marketing campaign implementer to understand how the marketing plan was ultimately executed in 2015. This task will provide the team with a basis for updating the survey instruments if needed.

Task 2: Review Marketing Materials (Option 1 Only)

The team will request all 2015 marketing materials and review them for their inclusion of the Mass Save logo and website. We will also note the messaging that is used and if it is consistent with stated campaign objectives. Finally, we will request web analytics and compare the level of activity and customer reach to previous years.

Task 3: Survey Design (Options 1 and 2)

As part of this task, the team will update existing survey instruments to ensure that they capture 2015 campaign activities and messaging.

Task 4: Sample Design and Survey Fielding (Options 1 and 2)

For the C&I survey, the team plans to use a sample design that is consistent with past studies and draw a random spample of customers from a combined PA customer database. For the 2014 study, we drew our sample from the 2013 C&I database that DNV GL assembled. We feel it is best to draw a sample from more recent customer data. We will request customer data from the PAs, create a combined customer file in which customers who are served by more than one PA are aggregated into a single contact, and draw a random sample of customers for fielding the survey.

For the residential survey, we will also request updated 2015 customer data from the PAs (the 2014 study used 2013 customer data). We will combine the data files into a single file and draw a random sample of customers following the 2014 sample design. We used a multi-mode fielding approach in 2014, which we will continue to use in 2015. This approach uses two different methods of customer outreach so that we effectively split the sample in two. We will conduct an outbound telephone survey with one portion of the sample. For the other portion, we will mail customers an invitation to complete the survey on-line or call into our telephone center and complete the interview with an interviewer over the telephone. This second approach helps us reach customers who increasingly do not answer telephone calls from unknown numbers. We will offer an incentive to encourage respondents to complete the survey.

For budgeting purposes, we have assumed 300 interviews C&I customers. We assume 500 residential completed interviews with 200 completed through the outbound telephone mode and 300 completed either on-line or as in-bound telephone interviews.

Task 5: Analysis and Reporting (Option 1 Only)

The team will provide the PAs with a written report containing the results and analysis of the materials review and survey data. The format of this report will be consistent with that provided for previous evaluations of the Mass Save statewide marketing effort.

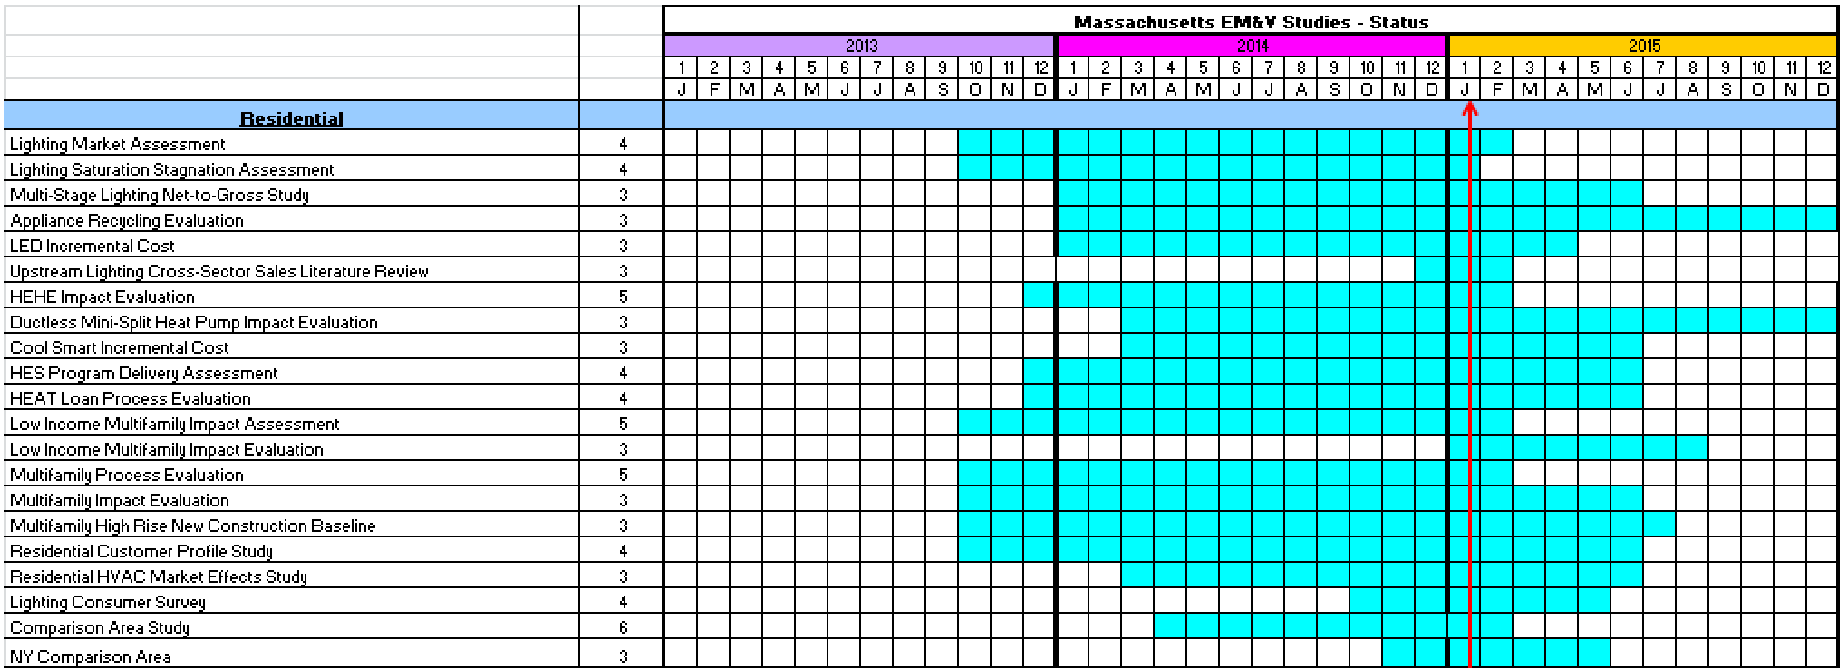
Task 5: Analysis and Reporting (Option 2 Only)

The team will provide a slide deck presenting key results and trend analyses from the C&I and residential surveys. We will also provide a topline that provides results to all survey questions.

Potential Budget: $172,000 (Option 1)
$153,000 (Option 2)

A APPENDIX A: GANTT CHART

The PAs and the EEAC consultants worked together to develop an EM&V overview, which provides details on evaluation studies. Study progress is reported quarterly via Gantt Charts. The Gantt Chart below is an example reflecting the **status of 2013-2015 studies**. As the Evaluation Plan evolves and new studies are initiated in 2016-2018, progress will be tracked in a similar format and provided with the quarterly updates.



B APPENDIX C: BASELINE WORKING GROUP

A working group was formed to establish a clearer determination of when, and how, baseline values are updated. To this end, the working group is developing a memo to guide this process. A finalized version of the memo will be included in subsequent versions of the Strategic Evaluation Plan.

A brief summary of this effort is as follows:

- To help in this process the PAs have prepared a flow chart that can be used by both program planners and evaluators to help determine if values other than federal or state codes should be applied as the baseline value for program measures.
- There are then three scenarios that could lead to baselines other than code: early replacement, intermediate efficiencies, and lack of code compliance.
    - It's important to note that these are not mutually exclusive; a measure may fall into multiple categories and thus have multiple baselines, and thus require a weighted baseline that would account for two or more of these scenarios.
- The memo is not intended to provide detailed specifics regarding the exact research activities and criteria that are to be used to determine non-baseline code: it does not provide specific survey or interview questions, research activities, or algorithms. Rather, it is intended to provide general guidance and direction for how baselines should be determined.
- The specific research activities and criteria, as well as other potential inputs (e.g., remaining useful life for early replacement measures, the revised incremental costs to reflect the changing baselines), should be determined as part of both the planning and EM&V processes.

T. **Evaluation Study Summaries**

APPENDIX T

Evaluation Study Summaries

Study 1: Massachusetts Residential Lighting Cross-Sector Sales Research

Type of Study: Market Assessment
Evaluation Conducted by: NMR Group
Date Evaluation Conducted: 3/24/2015

Study Objective and Summary of Results:

The objective of this research was to review evaluations conducted in other jurisdictions that estimate cross sector sales, i.e., the proportion of residential program lighting purchases that are installed in commercial rather than residential applications. Based on this review, the evaluation team recommended a "placeholder" value for cross sector sales to be used in Massachusetts (MA). This value is intended to be useful for the Program Administrators (PAs) for near-term planning.

Core Initiatives to which the Results of the Study Apply:

- Residential Lighting (electric) (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

The evaluation team recommends using a placeholder value of 7% to be applied to the Massachusetts upstream lighting program sales to reflect the proportion of residential program lighting used in commercial settings.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

If adopted, the estimate of 7% cross-sector sales would shift that percentage of savings from the residential to the commercial sector, including making adjustments for different hours of use in that sector.

Overview of Study Method:

The evaluation team performed secondary research into applicable studies conducted in other jurisdictions. The evaluation team reviewed 23 evaluation reports conducted in 10 states, each of which touched on the topic of cross-sector sales. The evaluation team considered not only the degree of cross-sector sales found in other studies (expressed as the percent commercial allocation), but also the extent to which those results could be applied to MA. The evaluation team assessed applicability to MA according to a variety of factors, including the program size and design, incentive type, bulb types supported, regional differences, and the time period and approach of the evaluation. The evaluation team prioritized those studies they expected would be most relevant in determining a placeholder for percent commercial allocation in MA.

The evaluation team also considered the various biases brought about by the different means of assessing cross-sector sales, and the implications of such biases for the eventual commercial allocation estimates.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 1.

Study 2: Multistage Lighting Net-to-Gross Assessment: Overall Report

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 8/25/2015

Study Objective and Summary of Results:

The purpose of this study was to describe various approaches to estimating net-to-gross (NTG) ratios for residential lighting energy efficiency programs. In addition the study explains the process used to develop and finalize NTG estimates, both retrospectively for 2014, and prospectively for 2016-2018. A group consisting of the Massachusetts PAs, Energy Efficiency Advisory Council (EEAC) consultants, and evaluation consultants reviewed the CFL and LED NTG and net-of-freeridership estimates derived for 2013 and/or 2014. In addition the group reviewed on-going evaluation research regarding current and projected future lighting prices. Considering this information and using a consensus-building process the group ultimately came to consensus on the recommended NTG estimates.

The report draws on NTG, net-of-freeridership, and other relevant information from the following evaluation studies or tasks:

- Multistage Lighting NTG Demand elasticity modeling;
- Multistage Lighting NTG, Saturation Stagnation, and Incremental Cost point-of-sale data analysis;
- Multistage Lighting NTG, Lighting Market Assessment, and Incremental Cost supplier interviews;
- Multistage Lighting NTG Lighting Market Assessment on-site saturation in Massachusetts, Georgia, Kansas and New York; and
- Incremental Cost web-based pricing modeling.

The study provides the following key findings:

- Each method of estimating NTG has relative strengths and weaknesses, such that any single method may not yield a reliable estimate of net savings. The purpose of applying multiple methods was to avoid overreliance on any single method and counterbalance the weaknesses of any individual methods.
- Drawing on the expertise of a team of researchers limits the biases in any individual's assessment of the strengths and weaknesses of various approaches.
- A consensus-building process that takes into account various NTG estimates and other relevant information reduces the bias inherent in the one-method/one evaluator approach.
- The study identified consensus values for retrospective and prospective NTG ratios for various products, as outlined in the recommendations below.

Core Initiatives to which the Results of the Study Apply:

- Residential Lighting (electric) (Electric Only)
- Residential New Construction (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

The evaluators recommend using the following NTG values in estimating program impacts.

Table 1. Consensus Retrospective and Prospective NTG Estimates

Product	Retrospective	Prospective		
	2014	**2016**	**2017**	**2018**
Non-Hard to Reach (HTR) Standard CFLs	53%	54%	53%	53%
HTR Standard CFLs	93%	93%	92%	91%
Non-HTR LEDs	-*	90%	80%	70%
HTR LEDs	102%	100%	99%	98%
All LEDs*	95%	93%	85%	78%
CFL Fixtures	NA	96%	96%	96%
LED Fixtures	NA	98%	93%	89%

* Non-HTR LEDs were not on the initial estimate template that was circulated because the PAs did not target LEDs to one market or the other in 2014. The evaluation team believes the best value to use for LEDs in 2014 is the overall "All LEDs" estimate. Moving forward, if the PAs decide to target some LEDs to HTR channels, then the differentiated results will become appropriate.

The evaluation team recommends that PAs closely monitor the market, and periodically revisit and if necessary revise the 2016-2018 NTG estimates. If these NTG estimates change substantially, the evaluation team recommends that policy makers allow PAs to apply the new NTG estimates to develop revised savings targets for the 2016-2018 period.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The prospective NTG ratios will be used for program planning purposes for the 2016 to 2018 program cycle.

Overview of Study Method:

The study used a consensus-building process among PAs, EEAC members, and evaluation team members to integrate NTG and net-of-freeridership estimates from previous research into finalized NTG values. The first step was for each party taking part in the discussions to review the estimates provided by each prior research approach. The second step was to reach agreement on appropriate overall NTG values by bulb type for 2014, which the group achieved by considering feedback on the differing research approaches and values, and reviewing saturation trends and EISA's schedule for phasing out inefficient lighting. The third step, once the group had agreed on the finalized retrospective NTG estimates for 2014, was to use those values as well as preliminary information from the incremental cost study (specifically anticipated price and market-share trends, converted to anticipated incremental costs and NTG ratios) and suppliers' future price predictions to provide insight and develop recommended prospective (that is, forward-looking) NTG estimates for the 2016-2018 program cycle as required by the Massachusetts DPU. Formal voting on a finalized value was not necessary, as the group was able to reach agreement on those values through a series of discussions.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 2.

Study 3: Lighting Market Assessment and Saturation Stagnation Overall Report

Type of Study: Market Assessment
Evaluation Conducted by: NMR Group
Date Evaluation Conducted: 8/25/2015

Study Objective and Summary of Results:

This report summarizes results from multiple studies that explored market reactions to energy efficiency lighting program interventions, including: 1) the 2014 lighting market assessment study, 2) the 2015 lighting consumer survey study and market assessment, 3) the 2014 lighting saturation stagnation study, 4) the 2014 comparison area research from Kansas and Georgia, and 5) the 2015 comparison area research from New York. The objective of these studies was to continue to monitor the Massachusetts lighting market for the Massachusetts PAs and the EEAC and to explore factors that drive energy-efficient socket saturation in Massachusetts and other states across the nation. The research also examined what circumstances might have explained the apparent stagnation in energy efficient lighting saturation that occurred in Massachusetts and other some states from 2009 to 2013. Together, the three studies characterized the overall residential lighting market, yielding critical information on the market and the PAs' intervention in it.

The study provides the following key findings:

- **Increased LED penetration and saturation in Massachusetts.** Penetration of LEDs—the percentage of homes using at least one LED—increased from 7% in 2012 to 33% in 2015, while the percentage of sockets filled with LEDs has grown 500% during the same time period (from 1% of sockets in 2012 to 6% in 2015).
- **Nearly ubiquitous CFL penetration and increased saturation, especially among low-income households.** Nearly all households in Massachusetts use at least one CFL (96%), a value that has held steady since 2012, while socket saturation increased from 28% in 2013 to 32% in 2015. Socket saturation of CFLs stood at 42% in low-income households compared to 28% for non-low-income households.
- **Program support has increased CFL sales.** Analysis of point-of-sale LightTracker data reveals that the removal of standard CFL incentives in New York in 2012 and California in 2013 are associated with decreases in CFL share, despite previously positive trends. In contrast, Massachusetts continued program incentives and saw its CFL market share increase during this time period.
- **Average wattage decreased per bulb for all bulbs between 2013 and 2015.** Results from an on-site panel of households visited multiple times revealed that participating households changed 1,554 sockets between 2013 and 2015, with the primary movement being from incandescent bulbs to CFLs and LEDs. As a result, average wattage of bulbs installed in homes decreased from 47.9W to 27.3W (delta Watts of 20.6).

Core Initiatives to which the Results of the Study Apply:

- Residential Lighting (electric) (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: The PAs should continue to provide incentives and educate consumers about LEDs in the next program cycle. At the same time, the PAs should monitor any new information that becomes available from future evaluations or other sources regarding delta Watts, measure life, price trends, and incremental costs, and be ready to shift LED strategy if providing incentives ceases to be cost effective.

Recommendation 2: The PAs and EEAC consultants should continue to fund regular on-site saturation studies—including the continued annual panel study—at least through the early 2020s in order to track the impact of Energy Independence and Security Act (EISA), changes in LED pricing and availability, and possible changes in effectiveness of incentives for standard and specialty CFLs and LEDs. Additionally, the PAs should work with the residential evaluation team to develop a methodology for identifying the diameter and length of fluorescent tubes in use in homes. Fluorescent bulbs are subject to increased efficiency standards through the Energy Policy Act (EPAct) of 2005, as implemented through the DOE General Service Fluorescent Lamp (GSFL) Rulemaking. The timing and depth of new on-site visits could potentially deviate from those performed annually by the evaluation team since 2009 given the expense involved, but the evaluation team believes that annual visits are ideal for a panel study and for new on-site visits.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

Many of these indicators provide the information that will ultimately contribute to revisions of program savings estimates while others contribute to a broader assessment of the market as EISA implementation moves forward.

Overview of Study Method:

The evaluation team completed six tasks for the Market Assessment and Saturation Stagnation studies that contributed to the findings reported in this document. A brief summary of each of those tasks is included below.

Consumer Surveys

The evaluation team conducted internet and telephone consumer surveys in Massachusetts, and telephone surveys in comparison areas in eastern Kansas and in Georgia in 2014. In 2015, the evaluation team conducted internet and telephone consumer surveys in Massachusetts and telephone surveys in upstate New York. In both years, the surveys assessed issues such as awareness and familiarity with various bulb types, knowledge of the lighting market, and satisfaction with CFLs and LEDs.

On-site Saturation and Panel Study Visits

In 2014, the evaluation team visited homes that had been identified through the consumer surveys in Massachusetts, Georgia, and eastern Kansas. In addition, the evaluation team continued an on-site panel study of homes that were first visited as part of an on-site saturation and hours-of-use study in 2013. The evaluation team returned to these homes to understand how their bulb saturation had changed over the past year and to see what types of bulbs they used to replace ones that burned out or were removed. In 2015 the evaluation team conducted on-site visits in Massachusetts and New York, and continued the on-site panel study of homes.

Shelf Stocking Study

The evaluation team worked with the implementation contractor to perform a shelf-stocking study in the fall of 2013. The study included currently participating and formerly participating stores. The study involved collecting data on the amount of shelf-space devoted to different types of light bulbs (CFL, LEDs, halogen, incandescent, and other bulb types), the number of bulb packages, and the number of bulbs of each type. The effort also examined the prices of bulbs and estimated the price differential between program-supported and non-supported standard and specialty CFLs and A-line and reflector LEDS.

Supplier Interviews

The evaluation team conducted supplier interviews in 2014 to learn how partner manufacturers, high-level buyers, and store managers familiar with lighting viewed the current lighting market and the program's impact on it. The study also looked to get insights from these partners on their view of the future of the lighting market. Specifically, the evaluation team performed in-depth interviews with manufacturers and buyers as well as computer-assisted telephone surveys with store or lighting-department managers. The interviews and surveys addressed a wide range of topics such as the impact of the EISA on sales of various bulb types, the impact of program activity on sales of various bulb types, expectations for future sales and price trends, the effectiveness of program strategies to increase sales among hard-to-reach customers, and satisfaction with various elements of the program.

Saturation Trend Comparison

In an effort to understand trends in saturation in Massachusetts, the evaluation team compared program and evaluation design and results between Massachusetts and comparison areas in New York and California. The evaluation team reviewed program reports and saturation data from New York and California and in-depth interviews with individuals associated with investor-owned utility lighting programs in California or who worked for the California Public Utilities Commission.

Point-of-Sale Data Analysis

The evaluation team examined data obtained from LightTracker Inc. to assess trends in light bulb sales, prices, and market share for the 44 states in the database. The evaluation team created statistical models to explain the effect of program activity on market share, controlling for other demographic and economic factors.

Application of Results: Retroactively and Prospectively

A copy of the complete study can be found in Appendix U, Study 3.

Study 4: Baseline Sensitivity Analysis 2016-2018

Type of Study: Impact Evaluation
Evaluation Conducted by: NMR Group
Date Evaluation Conducted: 7/30/2015

Study Objective and Summary of Results:

The objective of this evaluation was to develop a market adoption model to simulate the changing baseline for the lighting program based on recent market assessment work conducted by the residential evaluation team. This version of the market adoption model compared three scenarios for the 2016 to 2018 lighting market:

1. Energy Independence and Security Act (EISA) is strictly enforced with a hard stop on sales of non-compliant bulbs in 2020 (not considered likely at this time);
2. EISA continues with a long sale-through period of non-compliant bulbs (current situation and most likely scenario); and
3. EISA is repealed due to a political shift (not considered likely at this time).

This version of the market adoption model also incorporates updates from tasks completed for other lighting studies, including:

- Saturation Stagnation, Multistage NTG estimation, and Incremental Cost point-of-sale data analysis
- Lighting Market Assessment on-site saturation
- Lighting Market Assessment consumer surveys
- Lighting Market Assessment and Incremental Cost supplier interviews

Core Initiatives to which the Results of the Study Apply:

- Residential Lighting (electric) (Electric Only)
- Residential Multi-Family Retrofit (Electric Only)
- Residential Home Energy Services (Electric & Gas)
- Residential New Construction (Electric & Gas)
- Low-Income Single Family (Electric Only)
- Low-Income Multi-Family (Electric Only)

Evaluation Recommendations:

No formal recommendations were made in this evaluation.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

N/A (no formal recommendations were made in this evaluation)

How the Study Affected Program Results:

The evaluation yielded gross savings estimates of delta watts based on different scenarios of the residential lighting market in 2016 to 2018. These scenarios have informed program planning for the same time period. The basis for the delta watts for most deemed lighting measures flow from the work done in this model. The gross savings for lighting decline each year as the program gets closer to 2020.

Overview of Study Method:

The evaluation team constructed three predictions of what the lighting market might look like in 2016 – 2018 in the absence of any further program intervention. In each of the scenarios, the market shifts towards more efficient light bulbs, but the size of that shift and the mix of bulb types (halogens, CFLs, and LEDs) varies. Also, the model assumes a somewhat less aggressive increase in CFLs and more aggressive increase in LEDs compared to earlier versions of the model. The model continues to predict a decrease in gross savings attributable to lighting year over year.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 4.

Study 5: Lighting Interactive Effects Study Preliminary Results

Type of Study: Impact Evaluation
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 4/6/2015

Study Objective and Summary of Results:

The goal of this study was to determine the heating, ventilation, and air conditioning (HVAC) impacts of energy efficient lighting retrofits, using interactive effects (IE) factors. This analysis will allow the Massachusetts PAs and EEAC consultants to better understand and report the true impact of energy efficient lighting installations in the upstream program.

The study provides the following preliminary key findings:

Table 2: Average IE Factor in Massachusetts

Factor	Average IE Factor
Heating Fuel IE Factor (Btu/kWh)	2,237

Core Initiatives to which the Results of the Study Apply:

- Residential Lighting (electric) (Electric & Gas)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Since the inputs were heavily biased towards single family homes and included only single family participants in the Home Energy Services (HES) program, the evaluation team recommends reassessing the preliminary results by incorporating multi-family building types using recent data developed during the low income multi-family billing analysis and HVAC saturations and building types from the Residential Customer Profiling study.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

Results confirmed that lighting retrofits impact HVAC use, as measured by interactive effects factors. Energy efficient bulbs give off less heat than inefficient bulbs, resulting in more use of heating systems in the winter and less use of air conditioning in the summer once lighting retrofits are complete.

Overview of Study Method:

In order to best estimate the HVAC interactive effects attributable to lighting retrofits, the evaluation team developed simulation models based on building characteristics compiled from three sources:

1. The HES dataset containing audit data from 2010-2014;
2. Existing High Efficiency Heating Equipment (HEHE) models used in a recent program study; and
3. The HES Realization Rate analysis completed in 2013.

The team built and calibrated four models using the National Renewable Energy Laboratory's Building Energy Optimization (BEopt) software[1] (EnergyPlus engine). The models were based on heating type and number of building stories using billing data for statewide HES participants from 2010-2013. The evaluation team calibrated the models using customized inputs reflecting the HES participants. In order to calculate a single statewide average, the evaluation team chose Worcester as the centralized location to reflect both coastal and inland weather patterns. Models were calibrated to within 2% of the targets helping to ensure an accurate reflection of an average home in Massachusetts. The team also used efficient lighting load shapes developed for the Market Adoption model. The baseline was modeled as a simple 20% increase in lighting consumption. Load shapes were extracted and analyzed to determine the specific IE Factors.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 5.

Study 6: Program Assessment Tube TV Recycling

Type of Study: Market Assessment
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 3/24/2015

Study Objective and Summary of Results:

The purpose of this study was to assess the feasibility of expanding the MassSave Appliance Rebate program to offer rebates for recycling operable but old, inefficient tube televisions (CRT-TVs).

The study provides the following key findings:

- The evaluation team found that 20% of TVs assessed were CRT-TVs (targets for replacement), with the remaining 80% consisting of LCD/LED, plasma, or rear projection TVs (all considered efficient).
- The savings associated with replacement of primary CRT-TVs are estimated at 200kWh/yr while savings for secondary and other CRT-TVs are estimated at 70kWh/yr.
- About 12% of all TVs studied qualify for the recycling program as it stands. An additional 6% of TVs identified as older flat screen TVs and potentially valuable targets for recycling. Under the proposed recycling program, the average savings associated with replacement would be 33kWh/yr/house, a figure that would rise to 56kWh/yr/house if older primary flat screen TVs were also included.
- Typical CRT recycling costs are currently around $0.10/lb for fully intact TVs. A large scale recycling program such as the one proposed here is estimated to cost about $12 per (statistically larger) primary CRT-TV and about $8 per smaller secondary CRT-TV with older LCD/LED TVs costing about $10 to recycle.

While our team observed a reasonably high saturation of CRT-TVs, our research indicated that the remaining CRT-TVs were underutilized, small, and being naturally replaced by users.

Initiatives to which the Results of the Study Apply:

- Residential Consumer Products/Appliances (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

- Based on TV sales data and current TV breakdown, natural turnover appears to be replacing CRT-TVs with new efficient models. Therefore, the evaluation team recommends not expanding the existing recycling program to CRT-TVs. Alternatively, PAs could consider recycling all TVs (including LCD/LED TVs) older than 2010.
- Consider a follow up study to measure natural TV replacement in the Massachusetts market.
- Future studies should be conducted in 4-6 years to measure whether CRT-TVs are indeed being replaced naturally.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

The PAs will adopt recommendation to not expand the existing recycling program.

How the Study Affected Program Results:

The study did not affect the program results.

Overview of Study Method:
The evaluation team collected television data from 150 Massachusetts homes in conjunction with the lighting market assessment study. Out of 150 houses, the team identified 370 TVs, measuring the size and recording the technology type of each unit. The evaluation team also collected additional self-reported usage information such as the average hours of daily use, estimated purchase date, and the willingness of the customer to replace the unit if offered with free removal for secondary TVs and a $50 voucher for primary TVs.

Application of Results: Retroactively and Prospectively

A copy of the complete study can be found in Appendix U, Study 6.

Study 7: Cool Smart Incremental Cost Study

Type of Study: Market Assessment
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 7/31/2015

Study Objective and Summary of Results:

This incremental cost study estimated how manufacturing production costs and purchase prices of residential air conditioning (AC) and heat pump (HP) equipment change as equipment efficiency increases.

The study provides the following key findings:

- Higher efficiency AC and HP units often include bundled features that do not improve efficiency, such as louvered cases, sound dampening, and specialty thermostats.
- The study provides incremental costs required to achieve a given efficiency above a specified baseline defined in terms of the efficiency metrics of seasonal energy efficiency ratio (SEER), energy efficiency ratio (EER), and heating seasonal performance factor (HSPF).
- For a system combination of AC and air handler, the minimum incremental costs of improving from a 13.0 SEER baseline to 16.0 SEER and 18.0 SEER are $325 and $1,725, respectively.
- For a system combination of HP and air handler, the minimum incremental costs of improving efficiency from a 14.0 SEER baseline to 16.0 SEER and 18.0 SEER are $431 and $1,808, respectively.
- The study also provides incremental costs for a variety of other efficiency levels and system combinations.

Core Initiatives to which the Results of the Study Apply:

- Residential Heating and Cooling (Electric Only)

Evaluation Recommendations:

No formal recommendations were made in this evaluation.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

Although this study did not make any formal recommendations, the PAs are using the study's incremental cost results to update its evaluation of the cost effectiveness of the Cool Smart program.

How the Study Affected Program Results:

This study does not affect the energy or load savings estimated in this Plan for HVAC. However, it informs future program planning by providing the PAs a better understanding of the incremental costs consumers incur to increase the efficiency of their HVAC units.

Overview of Study Method:

The residential evaluation team examined Cool Smart tracking data provided by the Massachusetts PAs to determine the characteristics (manufacturer, equipment class, capacity, and efficiency rating) of units that are most frequently rebated through the Cool Smart program.

Based on analysis of tracking data, the evaluation team selected HVAC units for teardown, inspection, and cost modeling. The output of these cost models includes an estimated manufacturing production cost and retail purchase price for each unit modeled. The evaluation team adjusted the manufacturing cost models to exclude features that are not efficiency related. The evaluation team used weighted average markups to estimate the retail purchase price of each unit.

The evaluation team adapted the cost model to estimate the costs and prices of units that were not physically torn down or inspected in this analysis. To model these units and systems, the evaluation team conducted "catalog teardowns" by applying scaling factors to the teardown data and simulating teardowns using catalog information provided by manufacturers. In total, the evaluation team used catalog teardowns to model the costs of an additional 79 units which were used to estimate manufacturing production costs and price points for more than 450 unique system combinations.

The evaluation team plotted the resulting cost estimates in a series of cost-efficiency plots. On each of these plots, the evaluation team mapped the "efficiency frontier," which is defined here as the minimum incremental price (required to achieve a given efficiency for the systems that were modeled. The evaluation team mapped the efficiency frontier by identifying and recording the lowest cost system at each increment of efficiency gain.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 7.

Study 8: Home Energy Service Initiative and HEAT Loan Delivery Assessment

Type of Study: Process Evaluation
Evaluation Conducted by: The Cadmus Group
Date Evaluation Conducted: 7/31/2015

Study Objective and Summary of Results:

The purpose of the Home Energy Services (HES) initiative delivery and HEAT Loan assessments was to:

- Determining the relative strengths and weaknesses of the two HES delivery channels for the program: lead vendor and Home Performance Contractor (HPC).
- Assess the current overlap in the HES, High Efficiency Heating Equipment (HEHE), Cool Smart, and HEAT Loan programs.

The study provides the following key findings:

- HPCs and lead vendors offer complementary approaches, each with their own benefits and drawbacks. Providing services through both channels is likely helping to expand the reach of the HES initiative.
- HPC customers have lower rates of cross-program participation than lead vendor customers, which may be a result of lack of HPC understanding regarding program offerings and less proactive promotion of non-HES initiative offerings.
- The majority of customers find that the Energy Specialist’s recommendations for making energy-efficient upgrades in their homes are easy to understand; a smaller majority feels certain about how to navigate Mass Save offerings and incentives.
- Customers who participated through the lead vendor delivery channel indicated higher overall satisfaction with the HES initiative and found that the lead vendor recommendations were easier to understand; however, all customers reported being at least somewhat satisfied with the initiative regardless of delivery channel.
- The HEAT Loan has been successful in promoting deeper and broader savings, acting as a motivating factor for a select group of customers and a business tool for contractors.

Core Initiatives to which the Results of the Study Apply:

- Residential Home Energy Services (Electric & Gas)
- Residential Heating and Cooling (Electric & Gas)
- Other (specify below) (Electric & Gas)

Other: HEAT Loan

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: To encourage HPCs to further promote non-HES Mass Save offerings, consider exploring approaches for holding all HPCs accountable for cross-promoting programs and providing additional clarity to HPCs about non-HES program offerings.

Recommendation 2: Consider the following options for assisting HES customers in navigating the Mass Save offerings and incentives available to them: 1) Conduct additional research with customers to test their receptivity to a customized web portal, 2) Explore approaches for optimizing assessment delivery to more effectively disseminate information, encourage cross-program participation, and increase close rates, and 3) Streamline program materials by identifying needs for summary additional program materials and improving clarity and salience in program materials provided to customers in advance of home energy assessments.

Recommendation 3: Explore opportunities to further promote the HEAT Loan outside of the HES program.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

This study is not being applied directly to the estimated savings projected in this Plan. However, it informs program design and planning by providing strategic recommendations, including opportunities for achieving greater and deeper savings, improving program performance and effectiveness, and improving customer experiences.

Overview of Study Method:

The evaluation team calculated 20 key performance indicators by delivery channel. The evaluation team conducted in depth interviews with PA Program managers, lead vendors, HPCs, HEHE contractors, and HEAT Loan lenders. The evaluation team conducted surveys of program participants, non-participants, and HEAT Loan lenders. The evaluation team used survey data to undertake an Analytic Hierarchy Process analysis to understand the interplay of the HES initiative and the HEAT Loan.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 8.

Study 9: Residential Customer Profile Study

Type of Study: Market Characterization
Evaluation Conducted by: The Cadmus Group
Date Evaluation Conducted: 10/2/2015

Study Objective and Summary of Results:

The Residential Customer Profile Study (RCPS) was launched in 2014, using program data from calendar year 2013. The RCPS is intended to be an ongoing project to provide stakeholders with a state-wide view of Residential and Low-Income efficiency program participation, gross savings, and incentive spending across all Massachusetts PAs. This study provides the first geographic analysis of the Residential and Low-Income program impacts across all PAs as well as insight into patterns of participation across multiple initiatives.

The study provides the following key findings:

- This study found that in 2013, a total of 15,386 premises participated in two or more core initiatives (excluding Behavior / Feedback), representing 7.7% of the total of 200,523 premises that opted to participate in any initiative.
- Of all premises participating in multiple initiatives in 2013, the Home Energy Services initiative is the most common single point of entry to the residential efficiency program, representing 35% of all lead initiatives for the premises that participated in multiple initiatives.
- In 2013, a total of 6% of premises served by electric PAs participated in an electric efficiency initiative and 5% of premises served by gas PAs participated in a gas initiative (not including Behavioral / Feedback). In total, 7% of all PA premises in Massachusetts participated in a program in 2013.

Core Initiatives to which the Results of the Study Apply:

- Residential Consumer Products (Electric & Gas)
- Residential Lighting (electric) (Electric Only)
- Residential Heating and Cooling (Electric Only)
- Residential Behavior/Feedback (Electric & Gas)
- Residential Home Energy Services (Electric & Gas)
- Residential Multi-Family Retrofit (Electric & Gas)
- Residential New Construction (Electric & Gas)
- Low-Income Single Family (Electric & Gas)
- Low-Income Multi-Family (Electric & Gas)

Evaluation Recommendations:

- No formal recommendations were made in this evaluation.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

N/A (no formal recommendations were made in this evaluation)

How the Study Affected Program Results:

This study is not being applied directly to the estimated savings projected in this Plan. However, it informs program design and planning by providing a preliminary geographic-based view of Residential and Low-Income efficiency program participation, gross savings, and incentive spending across all Massachusetts PAs. The PAs would benefit from analysis on additional years of data beyond the 2013 benchmark to identify trends over time and investigate influences of different factors on the geospatial patterns observed in participation, savings, and incentive payments impacts as mapped.

Overview of Study Method:

The residential evaluation team collected data for this project through an analysis of billing records, program tracking records, and publicly available census and demographic data sets. Customer address records in billing and tracking data files were then normalized using a third-party software platform to revise them to US Postal Service standard address format.

The team developed a custom database and first loaded each PA's customer data records to establish a foundation of unique service premises. Program tracking records were joined to the specific premises established using customer billing records. Specific measure gross savings for each initiative were adopted from program tracking records or drawn from the Benefit-Cost Ratio (BCR) model files provided by PAs according to guidance they gave specific to certain initiatives and measures. In this way, total savings were established for each participating premises in an efficiency program.

Since the Upstream Lighting Initiative and Behavioral/Feedback initiative do not track savings at the premises level, the evaluation team used modelling techniques to include these impacts in the statewide views.

Participation, savings, and incentive spending data were aggregated for all initiatives and programs at the premises level as well as the census block group level in the database. The team produced maps illustrating the geospatial distribution of program impacts. For each fuel and program, the Team presented high-level demographic data for program participants versus non-participants.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 9.

Study 10: Multifamily Impact Findings Memo

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 10/5/2015

Study Objective and Summary of Results:

This study was designed to assess the impacts of the Multifamily Program's residential channel in terms of electric and natural gas savings. This impact analysis seeks to estimate gross and net energy savings associated with the program.

The study provides the following key findings:

- This study was not successful in developing savings estimates for this program. There were two key factors that contributed to this outcome. First, trying to perform the analysis at the account or premise level was determined to be a flawed approach. Second, the level of savings at the account/premise level made it difficult to discern the effect of the treatment from the data.
- The key finding of this work was that billing analysis for programs of this nature should be performed at the facility level where issues of attrition can be better handled and representation of program treatment better understood.

Core Initiatives to which the Results of the Study Apply:

- Residential Multi-Family Retrofit (Electric & Gas)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: The residential evaluation team recommended that the placeholder results from the study not be used by the Massachusetts PAs due to concerns with data sufficiency, sample representation and broader concerns stemming from analysis performed at the premise level.

Recommendation 2: The evaluation team further recommended that a new analysis at the facility level be performed for National Grid, where facility level activity is understood to be reliably tracked in a way that allows the aggregation of consumption and tracking data for each treated building.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The PAs have decided to adopt an assumed realization rate in the absence of results from this study. The team is currently in the process of performing a new billing analysis at the facility level for National Grid.

Overview of Study Method:

This study performed a two-stage, premise-level, difference-of-differences modelling approach for energy consumption analysis using a panel dataset combining consumption, weather, and participation and other premise and customer-specific characteristics. This approach was designed to estimate gross energy savings and relies on a comparison group consisting of past and/or future participants to control for non-program related change. The results of this study were reviewed with a working group of PAs and EEAC consultants and it was decided that the results were not reliable enough for use and that a new effort to perform the analysis at a facility level was needed. This new effort is being undertaken at this time.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 10.

Study 11: Ductless Mini-Split Heat Pump (DMSHP) Final Heating Season Results

Type of Study: Impact Evaluation
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 10/12/2015

Study Objective and Summary of Results:

As part of a large impact metering study, the Massachusetts PAs asked the residential evaluation team to determine heating season savings and full load hours associated with DMSHPs installed through the Cool Smart program.

The study provides the following key findings:

- Participants have an average of 447 heating equivalent full load hours (EFLH).
- Typical heating season savings for DMSHPs were 210 kWh.

Core Initiatives to which the Results of the Study Apply

- Residential Heating and Cooling (Electric Only)

Evaluation Recommendations:

Evaluators have made no final recommendations at this time, except to adopt a lower heating FLH value.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs adopted the recommendation for planning and are continuing to study the savings in a follow up study.

How the Study Affected Program Results:

Overall, the study results showed much lower heating FLH than earlier planning estimates.

As shown in the separate DMSHP baseline memo, the most common heating baseline for DMSHPs was a code-minimum DMSHP. Starting in 2016, all DMSHP units sold in the United States must meet a minimum heating season performance factor (HSPF) of 8.2, an increase from the current standard of 7.7 HSPF. The evaluation team calculated the FLH consistent with a HSPF-based savings calculation and savings compared to an 8.2 HSPF baseline, shown in Table 1 below.

Table 3. Draft Heating Season Full Load Hours and Savings

Stated Purchase Intent	Full Load Hours	Estimated Annual Savings – 8.2 HSPF Baseline (kWh)	Percent of Total
Purchased for Cooling	220	103	31%
Purchased for Heating	841	395	4%
Purchased for Heating and Cooling	531	250	65%
Average	**447**	**210**	**N/A**

Overview of Study Method:

The evaluation team metered approximately 150 participating systems during the winter of 2014-2015 and extrapolated their usage to a typical weather year. Some of the metered inputs included power of the DMSHP outdoor compressor, runtime of the air handling fan, temperature and humidity of the outdoor unit and temperature and humidity of the indoor spaces. These inputs, along with manufactures curves, were used to calculate the FLHs and total kWhs of energy used. Combining these results and the baseline memo referenced above, the PAs were able to estimate the total heating energy savings as shown in Table 1. Some of the winter weather season had to be removed due to abnormal snow amounts in February and March. In all cases, the systems included in the analysis had at least eight weeks of metered data including operation during cold weather and more mild weather that spanned the operating range of the equipment. As a follow up, the PAs have decided to leave the meters in for another winter to hopefully encounter a more typical winter and verify the results presented above.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 11.

Study 12: Ductless Mini-Split Heat Pump (DMSHP) Baseline Determination

Type of Study: Impact Evaluation
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 10/22/2015

Study Objective and Summary of Results:

As part of a large impact metering study, the Massachusetts PAs asked the residential evaluation team to determine the appropriate baseline for installed ductless mini-split heat pumps (DMSHP) promoted through the electric PAs' Cool Smart program. The results of the study will be used to estimate gross energy efficiency impacts of the DMSHP component of the program. The study provides the following key findings:

- The program design implies that the baseline should be code.
- The influence of the program on customer decisions to install any kind of DMSHP is unclear at this time. A small portion of customers stated that they would have left the space unconditioned if not for the DMSHP measure. These responses were interpreted 1 of 2 ways; 1) the customer would have installed either a standard DMSAC or DMSHP or 2) would have installed no heating and/or cooling in the absence of the DMSHP incentive. In the case that assumes no fuel switching in the baseline, this has very little influence on the resulting baseline mix and resulted in a standard DMSHP baseline ranging from 90% to 94% of installations.
- The evaluation team has developed baselines for a case where fuel switching is allowed and one where it is not in case fuel switching is allowed in the future.

Core Initiatives to which the Results of the Study Apply

- Residential Heating and Cooling (Electric Only)

Evaluation Recommendations:

The evaluation team has made no formal recommendations at this time, except to present a possible baseline mix consistent with the draft scenarios presented.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

N/A (no formal recommendations were made in this evaluation)

How the Study Affected Program Results:

The study found that the most appropriate baseline assuming a no fuel-switching scenario was a standard efficiency DMSHP. The current code for a DMSHP is a SEER 14, HSPF 8.2 and should be used in future years as the DMSHP baseline. The study also presented results for a scenario in which fuel switching is allowed, in the event that it is needed for a future change to the program.

Overview of Study Method:

The determination of appropriate baselines is based on information gathered from program participants during on-site visits to install meters that measure the energy usage of the DMSHPs and other heating and cooling equipment. The baseline determination depends on:

1) The actual displaced equipment found in each home;
2) Customer intentions – whether customers purchased the DMSHP[2] for its cooling capability, its heating capability, or both; and
3) Stated alternative actions to purchasing the DMSHP, relative to the customer's purchase intentions.

These considerations helped determine what the customer would have chosen absent of the DMSHP incentive and thus the most appropriate baseline. The total number of participants included in this sample was 116. The results were presented in four different ways. Two iterations were based on a no-fuel switching and a fuel switching scenario. The other two scenarios were based on a small portion of customers stating that they would have left the space unconditioned if not for the DMSHP measure. These responses were interpreted 1 of 2 ways; option 1) the customer would have installed either a standard DMSAC or DMSHP or option 2) would have installed no heating and/or cooling in the absence of the DMSHP incentive. The current program design and incentive levels were determined based on a no-fuel savings case. In the no fuel savings case, 90% (option 2) to 94% (option 1) of the installation, depending on the scenario, were determined to have a DMSHP as the baseline, 6% (both option 1 and option 2) were determined to have the existing equipment baseline and between 0% (option 1) and 4% (option 2) were determined to have no heating system as the baseline. Due to the overwhelming majority having a DMSHP as the baseline, it was determined to use the DMSHP baseline at this time.

Application of Results: Prospectively

2 DMSHP is referenced as singular – recognizing that in many homes these are systems that may have multiple condenser units and/or head units in a single home.

A copy of the complete study can be found in Appendix U, Study 12.

Study 13: Massachusetts Low-Income Multifamily Initiative Impact Evaluation

Type of Study: Impact Evaluation
Evaluation Conducted by: The Cadmus Group
Date Evaluation Conducted: 10/5/2015

Study Objective and Summary of Results:

The purpose of this study was to verify the energy impacts and improve the transparency and consistency of the estimated savings in the Massachusetts Low-Income Multifamily (LIMF) Initiative. This was the first impact evaluation of the LIMF Initiative, and combined engineering analysis and tracking data review, billing analysis, direct measurement, and on-site verification.

The study provides the following key findings:

- The residential evaluation team produced evaluated statewide deemed savings values for all non-custom measures implemented in the initiative to improve transparency, consistency, and accuracy across the PA initiatives.
- Through billing analysis of 217 facilities, the evaluation team estimated an average savings of 126 therms per dwelling unit or 21% of pre-retrofit natural gas consumption.
- Compared to the initiative ex ante estimates, the billing analysis results represent an average statewide realization rate of 80%, indicating that the initiative is achieving 80% of the reported natural gas savings.
- The majority of projects that received natural gas efficiency measures to reduce heating consumption also received efficient lighting measures, which increase heating loads because they produce less waste heat. Separating out the lighting interactive effects on the heating load increases the realization rate to 83% - 89%.
- The evaluation team estimated a statewide realization rate of 97% for common area lighting measures, verifying that auditors are accurately estimating annual energy savings.
- Through inspection of showerheads and faucets within 20 apartment units, the evaluation team confirmed that all showerheads were below the 2.5-gallon-per-minute maximum threshold and most faucet aerators were below the 1.5-gallon-per-minute threshold.
- Through documentation of the cooling type at all 56 projects in the common area lighting sample, the evaluation team estimated that 89% of facilities use window air-conditioning as the primary cooling equipment.
- Finally, through literature review and examination of the primary data collected in this study, the evaluation team estimated deemed values for secondary impacts such as water savings from faucet aerators, showerheads, and clothes washers.

Core Initiatives to which the Results of the Study Apply:

- Low-Income Multi-Family (Electric & Gas)

Evaluation Recommendations:

No formal recommendations were made in this evaluation.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

N/A (no formal recommendations were made in this evaluation)

How the Study Affected Program Results:

The results of this evaluation serve to increase the projected energy savings from some measures while decreasing them for others. The evaluated savings for all of the natural gas measures are lower than the reported savings. The evaluated savings for common area lighting are slightly higher than the reported savings for National Grid (101%), and slightly lower for Eversource (96%) and statewide (97%).

The evaluated deemed savings values for the following electrical measures are greater than the values previously reported in the Massachusetts Technical Reference Manual:

- LED Bulb
- Showerhead
- TLC Kit (Eversource and CLC only)

The evaluated deemed savings values for the following electrical measures are lower than the values previously reported in the Massachusetts Technical Reference Manual:

- Torchiere
- CFL Bulb
- Window AC Replacement
- Refrigerator
- 2nd Refrigerator Removal
- Freezer Replacement
- Clothes Washer
- Heat Pump Water Heaters (50 Gallon)
- Faucet Aerator

Overview of Study Method:

For measures not requiring primary data collection, the evaluation team used existing literature and engineering analysis to determine the best method for estimating savings. The evaluation team also conducted a billing analysis to estimate savings using a combination of regression models. The evaluation team metered lighting hours of use for a variety of common area space types to determine realization rates relative to ex ante energy savings. The evaluation team also conducted on-site visits to verify installed equipment and operating parameters. Finally, the evaluation team explored project benefits beyond primary fuel conservation by reviewing the estimation of water savings and the impact of weatherization measures on cooling season energy consumption.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 13.

Study 14: Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification

Type of Study: Process Evaluation
Evaluation Conducted by: Research Into Action
Date Evaluation Conducted: 6/19/2015

Study Objective and Summary of Results:

The purpose of this study was to: 1) assess reasons for low rates of Building Operator Certification (BOC) in Massachusetts, with the eventual goal of identifying how to increase the number and share of PA customers who achieve BOC credentials with the assistance of PA training subsidies; 2) develop a better understanding of the factors that influence BOC savings; and 3) provide updated values for the MA TRM for BOC.

The study provides the following key findings:

- The primary motive for many MA BOC students is learning the subject matter, not obtaining the certification; emerging work demands are a key barrier to obtaining certification.
- Reducing the burden on applying for subsidies may be the best way to increase the number of subsidy applications.
- Multiple studies, varying in assessment approach and methodological rigor, have produced varying estimates of the per-student energy savings from BOC.
- Training multiple BOC operators at a site likely produces incremental increases in energy savings for that site.
- Level 2 BOC certificants may generate more savings than Level 1 certificants, but there is insufficient information with which to attribute the incremental savings to the differences in certification level and/or other differences between Level 1 and Level 2 students.
- PAs across the country claim energy savings for BOC training and/or certification for a minimum of one year after certification to a maximum of five years following expiration of certification.
- BOC energy savings may vary by building end-use, with schools possibly providing the lowest savings and government-owned buildings the highest.
- A variety of energy efficiency education and training programs besides BOC exist that have demonstrated the potential to generate energy savings by building operators, managers, and occupants.

Core Initiatives to which the Results of the Study Apply:

- C&I Retrofit: Existing Building (Electric & Gas)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: The Massachusetts PAs should employ multiple channels to promote BOC and the subsidies.

Recommendation 2: The PAs should craft BOC messaging that conveys the value proposition of certification and maintenance of certification to high-level managers.

Recommendation 3: The PAs should encourage high-level managers who take the training to also send their operators with day-to-day O&M responsibilities.

Recommendation 4: The PAs should promote BOC to participants of other energy efficiency programs.

Recommendation 5: The PAs should claim savings for each subsidized customer for eight years from the initial year of certification – that is, for the year of certification plus seven additional years.

Recommendation 6: The PAs should *not* claim additional savings for an individual's Level 2 certification beyond those claimed for Level 1 certification.

Recommendation 7: The PAs should claim two-thirds of the recommended per-operator savings for a second subsidized operator at a given workplace.

Recommendation 8: The PAs should consider designing and implementing additional adult efficiency education/ training programs.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

This study is not being applied directly to the savings estimated in this Plan. However, it informs future program planning for those PAs planning to offer BOCs by providing a series of recommendations for improving the BOC rate among the MA PAs' customers and how the associated savings should be claimed.

Overview of Study Method:

The evaluation team members carried out the following research activities:

- Analyzed indicators of BOC market penetration to compare penetration in Massachusetts with the rest of the country.

- Interviewed:
    - 14 BOC program managers and one contractor for the PAs in Massachusetts and elsewhere.
    - Two contacts for a regional BOC implementer.
    - 24 Massachusetts BOC participants.
- Reviewed 11 studies reporting BOC savings estimates.
- Reviewed 16 non-BOC adult energy efficiency (EE) education and training programs offered by PAs, private organizations, and governmental entities to identify other opportunities to promote and support energy efficiency.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 14.

Study 15: Comprehensive Review of Behavior and Education Programs

Type of Study: Process Evaluation
Evaluation Conducted by: Navigant Consulting
Date Evaluation Conducted: 6/30/2015

Study Objective and Summary of Results:

The purpose of this study was to provide a comprehensive review of behavior and education (K-12) programs for the Massachusetts PAs and the EEAC.

The study provides the following key findings related to behavior-based programs:

- There is a wide array of residential behavior programs that leverage various combinations of behavioral strategies. Most have not been tested at scale.
- Home Energy Report and Feedback programs are the most widely tested though many questions remain regarding program design and implementation.
- Many utilities serving small markets implement Home Energy Report programs, though several have needed to adopt strategies to improve cost-effectiveness, such as: more careful selection of vendors, entering partnerships to achieve economies of scale, reconsidering evaluation methods and requirements for claiming savings, and possibly supporting a measure life of more than one year.
- Behavioral programs identified as being particularly effective in small markets have a high level of customer engagement (often involving in-person/community interaction).
- There are several classes of commercial behavior programs. These programs typically rely on employee engagement, social interactions, competitions, feedback and benchmarking.
- Recent trends in
  - Residential behavior programs include enhanced customer access and engagement, interaction with end-uses, and a multi-pronged approach.
  - Commercial behavior programs include use of competitions, workplace engagement and business energy reports.

The study provides the following key findings related to K-12 education programs:

- A diverse landscape of educational programs leverages various combinations of behavioral strategies, similar to those seen in other behavior-based programs.
- In addition to traditional kit-based K-12 programs, a large number of school-wide and classroom-based education programs utilize behavioral strategies to reduce student energy use at school and at home.
- Most non-kit behavior-based energy efficiency programs currently employ savings calculation methodologies in line with industry current practice, rather than randomized control trials (RCTs) or regression-based methods. Many utilities are able to claim savings based on these methods. There are many

examples of non-kit programs working with utilities to develop more rigorous methods for evaluating savings, including the use of RCTs.

- Recent trends in
    - K-12 programs include alternatives to traditional kit-based programs, using a multi-pronged approach, and leveraging feedback technologies.
    - Savings methodologies in K-12 programs include partnerships with utilities, use of Advanced Metering Infrastructure, and use of RCT and Matching methods.

Core Initiatives to which the Results of the Study Apply:

• Residential Behavior/Feedback	(Electric & Gas)
• C&I Retrofit: Small Business	(Electric & Gas)
• Other (specify below) – K-12 Education Facilities	(Electric & Gas)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Test alternative residential behavior-based program offerings. Programs relying on web portals and smartphone applications can provide lower cost opportunities with comparable savings to the HER program. However, these programs may provide less opportunity for wide-scale implementation as not all customers have computers or smartphones.

Recommendation 2: Consider conducting an opportunity assessment of existing program offerings to identify opportunities for employing behavioral strategies, such as commitments and framing, to further enhance program participation. Although the Home Energy Services and low-income programs already have behavioral and education components, additional integration opportunities may remain.

Recommendation 3: Further explore opportunities for addressing barriers faced by PAs serving small markets in delivering behavior-based programs, particularly around partnership, evaluation methods and requirements for claiming savings, and assumptions regarding measure life.

Recommendation 4: Consider testing a workplace engagement program to initiate experience with small and medium commercial behavior programs.

Recommendation 5: Consider implementing kit-based education programs. Involve appropriate stakeholders in design and implementation to ensure behavioral savings can be quantified and claimed. Typically, savings are determined using TRM values for kit measures, applying measure-specific installation rates.

Recommendation 6: Monitor the outcome of K-12 programs promoting school-wide energy-saving through culture change in similar jurisdictions with periodic, targeted reviews of key programs cited in this research.

Recommendation 7: Consider the possibility of path-breaking, targeted research around behavior-based programs in higher education. Due to the number of college and university students per capita, Massachusetts may reap higher benefits from such efforts relative to other states. Many of the behavioral strategies and K-12 program models have application in a higher education setting.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

This study is not being applied directly to the savings estimated in this Plan.

Overview of Study Method:

Navigant relied on interviews and a secondary literature review to conduct the review of behavior and education programs. Given that most of the current and ground-breaking developments are not yet published, the informational interviews provided access to the most recent information on trends to develop a better understanding of the evolving landscape of behavior and education programs. The review of secondary literature sources complimented and enhanced the primary research findings.

Navigant conducted in-depth interviews and informational interviews with over twenty thought-leaders including researchers, PAs, program implementers, policy makers and more. In addition, the team reviewed conference proceedings, evaluation reports, whitepapers, academic research, utility websites, vendor websites, regulatory filings and more to conduct the secondary literature review.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 15.

Study 16: Massachusetts Behavioral Programs Process Evaluation

Type of Study: Process Evaluation
Evaluation Conducted by: Navigant Consulting and Illume Advising
Date Evaluation Conducted: 7/31/2015

Study Objective and Summary of Results:

The purpose of this study was to collect process feedback of and insights into the long-standing behavior programs in Massachusetts. Due to the large number of programs and PA cohorts, the evaluation team examined the survey results by fuel treatment type (electric, gas, combined dual-fuel, and cross PA).

The study provides the following key findings:

- Overall, customers remain satisfied with the Home Energy Reports (HER) and the frequency of treatment. Across fuel groups, 74% to 80% of customers indicated that they want the reports to be sent at "about the same" frequency as they are now.
- The survey results also suggest that the HER programs are enhancing customer satisfaction among electric treatment groups, who are statistically more satisfied than control groups with the energy efficiency services received from their PA (mean scores of 3.58 vs. 3.42 respectively, on a five-point scale where five is very satisfied). There is a clear lift in energy-saving actions among treatment customers above their control counterparts and findings, most of which are independent of other programs. Several measures experiencing "lift" (statistically significant difference in treatment actions over control) have long measure lives, such as 25 years for insulation (building envelope category) and 15 years for energy efficient furnaces (heating/cooling category).[3] Notably, the reports also appear to support the maintenance of conservation-based behaviors[4].
- Most energy saving actions appear to be independent of other programs (i.e. received no financial incentives), though gas customers showed greater cross-program participation.
- Further, the data suggest that customers who are treated with one fuel, such as electric, are taking action in other fuels (such as gas, water).

Core Initiatives to which the Results of the Study Apply:

- Residential Behavior/Feedback (Electric & Gas)

[3] Massachusetts Technical Reference Manual, 2013-2015 planning period.
[4] As a part of the survey, the evaluation team asked customers whether they regularly took specific behaviors in the past year. For behaviors that did not start or increase in frequency in the previous year, customers began these behaviors in previous years and are still maintaining them.

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: While the savings associated with other programs cannot be double-counted across the portfolio, the net benefit of cross-program promotion and participation is positive. The PAs and EEAC should consider mechanisms to balance the "costs" of cross-program effects to avoid undue burden on the HER program where cross-program savings are substantial. Options for consideration include prorating these benefit adjustments to all programs, or conducting joint benefit-cost tests across the affected energy-efficiency and behavior-based programs.

Recommendation 2: Overall, feedback from cross PA customers is positive and similar to most other fuel groups. Therefore, PAs should continue with the current treatment for these customers without concern of negative customer satisfaction side effects.

Recommendation 3: The PAs should consider conducting more comprehensive exploratory research, such as in-home ethnography, to identify the potential for home automation solutions to target plug load. Across the interviews, this was the most commonly cited end use where customers were interested in additional support and solutions. Further, customers admit that actions like unplugging appliances and switching off power strips are too burdensome to take on a regular basis. It is important to note that this research is currently underway in in Massachusetts and follow-up research has been proposed for 2016.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

This study is not being applied directly to the savings estimated in this Plan.

Overview of Study Method:

The evaluation consisted of the following major activities:

1. Telephone survey with treatment (~2100) and control group customers (~2100) across electric, gas, and dual fuel customers in Eversource and National Grid's territory. The surveys measured actions taken in the past year and satisfaction with the HES report.

2. In-depth interviews with 24 treatment customers to explore their interactions with the reports and energy saving behaviors in more depth.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 16.

Study 17: 2014-2015 Commercial and Industrial Natural Gas Programs Free-ridership and Spillover Study

Type of Study: Impact Evaluation
Evaluation Conducted by: Tetra Tech
Date Evaluation Conducted: 8/10/2015

Study Objective and Summary of Results:

The purpose of this study was to quantify the net impacts of the 2014-2015 C&I natural gas energy efficiency programs by estimating free-ridership, participant "like" spillover and non-participant "like" spillover. A secondary objective of the study was to assess how free-ridership varies between Green Communities and non-Green Communities.

The study provides the following key findings:

- The study produced free-ridership, participant spillover and non-participant spillover rates for each PA by program and end use.
- Overall, the statewide net-to-gross rates (NTGRs) for this study (87 percent) were similar to the 2011 gas study (90 percent), but significantly higher than the 2010 gas study (79 percent). In addition, NTGRs varied dramatically by measure type both between evaluation years and among PAs for a given year. Two factors driving this variability that the evaluation team was able to observe were: 1) the categorization of measures into measure types varied between PAs and over time, and 2) some end uses and PAs had a small number of participants that make the estimates more volatile.
- Custom measures had a higher overall NTGR (88 percent) than prescriptive measures (76 percent).
- End-uses with the highest NTGRs in 2014-2015 included steam traps (114 percent), water saving measures (102 percent), water heating (97 percent), and other (92 percent). End-uses with the lowest NTGRs were food service (56 percent), thermostats (70 percent), and comprehensive (74 percent).
- The overall statewide NTGRs for municipal buildings within a Green Community (91 percent) are less than to those for municipal buildings within non-Green Communities (110 percent).

Core Initiatives to which the Results of the Study Apply:

- C&I New Construction: New Buildings & Major Renovations (Gas Only)
- C&I New Construction: Initial Purchase & End of Useful Life (Gas Only)
- C&I Retrofit: Existing Building (Gas Only)
- C&I Retrofit: Small Business (Gas Only)
- C&I Retrofit: C&I Multi-Family (Gas Only)

Evaluation Recommendations:

Results from this study are used by the PAs in setting prospective NTGRs in their three-year plans. When results are based on more than 10 survey records, the PAs should use PA-specific results. When sample sizes are not sufficient (10 completed surveys or less), PAs should use statewide figures. The report contains the recommended NTGR values for filing purposes.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs plan to adopt the recommendations.

How the Study Affected Program Results:

The updated NTGRs will be applied to the PAs' savings estimates for C&I gas measures for 2016 through 2019. The change in net savings varies by PA, program, measure, and/or end use.

Overview of Study Method:

The methodology used for this study follows the standardized methodology developed in 2010 and 2011 for the Massachusetts PAs for use in situations where end-users are able to report on program impacts via self-report methods. [5]

As recommended in that report, the current study: 1) implemented two waves of the free ridership survey so that participants were contacted as soon as possible after the project was completed, and 2) implemented the spillover survey with 2013 program participants in order to allow more time for spillover to have occurred. The study also included interviews with design professionals and equipment vendors involved in the 2014-15 installations.

With separate populations surveyed for the free-ridership and spillover studies, net-to-gross results incorporate savings from each study. For that reason, a particular measure type may have free-ridership, spillover, or both reflected in its net-to-gross estimate.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 17.

[5] "Cross-Cutting C&I Free-Ridership and Spillover Methodology Study Final Report", prepared for the Massachusetts Program Administrators by Tetra Tech, KEMA, and NMR, May 20, 2011.

Study 18: Efficient Neighborhoods+ Incremental Cost Assessment

Type of Study: Impact Evaluation
Evaluation Conducted by: Opinion Dynamics
Date Evaluation Conducted: 7/8/2015

Study Objective and Summary of Results:

The purpose of this study was to estimate the incremental costs incurred by the Massachusetts PAs to design and implement the first round of the Efficient Neighborhoods+SM initiative.

The study provides the following key findings, despite uncertainties in the incremental cost estimates:

- Considerable per-participant and per-unit of energy costs for the initiative. Across all PAs combined, the incremental costs are $470 per EN+ participant, $0.13 per annual kWh saved, and $5.86 per annual therm saved. To put these costs in perspective, the cost per annual kWh saved by the Residential program portfolio in Q4 2014 was $0.40, while the cost per annual therm saved during the same time frame was $6.17.[6]
- Economies of scale might diminish incremental costs as an initiative expands. Comparison of per-participant costs across communities revealed that as the number of targeted customers increased, per-participant costs decreased. This is not surprising because larger communities should have a larger absolute number of participants yet some of the costs either remain fixed as the number of targeted customers increases (such as planning and design costs, marketing and collateral development) or increase only incrementally (distribution of marketing and collateral to a larger group of customers).
- As part of the initiative, PAs spent a considerable amount of incremental dollars to achieve savings for fuels other than gas and electric. More specifically, over $39,000 was paid in incremental incentives for savings from other fuels. This amounts to 57% of all incremental incentive dollars paid and 9% of overall incremental costs.

Core Initiatives to which the Results of the Study Apply:

- Other (specify below) (Electric & Gas)
  Pilot programs and community-based initiatives

[6] http://ma-eeac.org/wordpress/wp-content/uploads/MA-EEAC-Consultant-Team-2016-18-Three-Year-Goals-Framework-Memo.pdf

Evaluation Recommendations:

The following considerations were made by the evaluators conducting this study.

Consideration 1: PAs should consider deploying cost tracking mechanisms as part of future efforts to allow for a more accurate estimation of incremental costs. Incremental cost data were difficult to obtain and were often based on rough estimates. Incremental incentive data were not clearly tracked and required a considerable amount of time to parse out. Incremental administrative cost data were also not tracked and therefore based on rough estimates from data provided for more than one community. Many of these difficulties were due to internal and external staffing changes and required the evaluation team to make assumptions when preparing the data.

Consideration 2: The results suggest that scaling up EN+ by either targeting more customers in a single community or engaging multiple communities will result in lower incremental costs per participant. The results, however do not account for additional gains in economies of scale due to statewide implementation (e.g., spreading and amortizing design and start-up costs, systematizing and centralizing staffing, recycling marketing, etc.). Scaling the initiative, however, may not be a feasible option for smaller PAs whose service territory limits the number of customers and communities that they can engage.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

N/A (no formal recommendations were made in this evaluation)

How the Study Affected Program Results:

This study is not being applied directly to the savings estimated in this Plan.

Overview of Study Method:

For the purposes of this assessment, incremental costs include the following four cost sources:

- Incremental incentives paid for measures installed as part of the initiative
- Incremental marketing costs incurred by PAs and implementation contractors
- Incremental administrative (labor) costs incurred by PAs
- Incremental administrative (labor) costs incurred by implementation contractors

The administrative cost data are based on rough PA and implementation contractor estimates due to the amount of time elapsed since the initiative implementation. The evaluation team leveraged the incremental marketing data collected previously for the EN+ evaluation in 2014, which the evaluation team confirmed again with the PAs. The incremental cost data analysis included the following steps:

- Analysis of program tracking data to isolate incremental incentives associated with the EN+ initiative
- Conversion of incremental staff hours into costs using wage rate data from the United States Bureau of Labor Statistics (BLS)
- Allocation of incremental costs by PA and community
- Imputation of missing cost data
- Normalization of incremental costs by participation and energy savings

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 18.

Study 19: Prescriptive Gas Impact Evaluation: Steam Trap Evaluation Phase 1

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 6/17/2015

Study Objective and Summary of Results:

The purpose of this study was to identify the best available methods for calculating the deemed savings for steam traps and assumptions for their measure life. The evaluation team also used the study as an opportunity to solicit general feedback on program delivery and other factors.

Since steam trap lifetime references are not well established in the literature, the evaluation team supplemented its literature review with information solicited directly from steam trap vendors/manufacturers, and investigated the existence of Massachusetts gas customer facility records that could: 1) provide historical documentation of steam trap replacement, and 2) directly support steam trap measure lifetime conclusions.

The study provides the following key findings:

- The evaluation team's review of over twenty available steam trap references including technical reports, energy efficiency evaluations, manufacturer publications, energy efficiency program resource manuals, and other savings documentation, suggests that a measure life of six years is more appropriate. The evaluation team's literature review found that all source materials except for the Massachusetts and Rhode Island Technical Resource Manuals utilized a lifetime assumption of five to six years for steam trap measures and was based largely on Delphi method of manufacturer interviews. Analysis of data for Massachusetts gas customer facilities that had annual steam trap surveys conducted on an ongoing basis also provided support for a lifetime assumption of six years.
- The literature review also showed that there are several analytic methods to calculate the energy savings achieved from the repair or replacement of failed steam traps. Massachusetts appears to have the only efficiency program that uses two calculation methods that have been effectively "calibrated" to both provide consistent savings values. Meetings conducted with steam trap vendors and the PAs' subcontractors suggest that adoption or refinement of a small number of common assumptions would further increase the accuracy and consistency between the two existing tools.
- Gas customers, vendors, and manufacturers indicated that gas savings through steam trap repair and replacement can be increased through both broader participation and heightened customer awareness.

Core Initiatives to which the Results of the Study Apply:

- C&I Retrofit: Existing Building (Gas Only)

- C&I Retrofit: Small Business (Gas Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Continue providing two steam trap programs, prescriptive and custom, to accommodate the wide variation in steam pressures and sizes, types, and number of steam traps; facility size; processes by which steam traps are repaired; and applicable savings methods and values.

Recommendation 2: Increase measure lifetime from three to six years based on the evaluation team's literature review and analysis of MA gas customer survey data.

Recommendation 3: Convene a steam trap stakeholder group – composed of PA staff members directly involved with steam traps, program implementation subcontractors, and steam trap repair/replacement vendors—to identify common assumptions/inputs to use in the savings algorithm, with the goal of improving program accuracy and consistency at the state-wide level. Any changes recommended by the stakeholder group would ultimately need to be verified and approved by the individual PAs.

Recommendation 4: Develop a new prescriptive steam trap deemed savings value using the savings algorithm developed in Phase 2 (per the recommendation above).

Recommendation 5: Leverage the steam trap stakeholder group to identify approaches to increase program participation and savings.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are adopting the study's recommended measure life of six years. The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The study produced a finding that increases the steam trap measure life in this 3-Year Plan (six years) in comparison to prior program years (three years).

Overview of Study Method:

DNV GL conducted five major tasks:

- Conduct in-depth industry and literature research on steam traps focusing on the methods employed for calculating their deemed savings and the assumptions on their measure life
- Conduct and provide a summary of meetings with vendors/manufacturers most active with repair/replacement of steam traps in Massachusetts
- Collect and analyze actual Massachusetts gas customer facility data to determine measure life
- Provide a technical discussion of steam trap savings calculations currently in use in the industry and other efficiency programs
- Provide recommendations for the best approach for adjusting the current steam trap prescriptive program deemed savings value

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 19.

Study 20: Prescriptive Programmable Thermostats

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 9/14/2015

Study Objective and Summary of Results:

The purpose of this study was to identify a deemed savings value for programmable thermostats (PTs) used only for gas-fired heating at C&I facilities.

The study provides the following key findings:

- Based on survey results and billing analysis, a savings of 5.3 therms per year per programmable thermostat, with a standard error of 3.8 therms, was initially estimated. This initial estimate was much lower than that specified in the TRM (77 therms per year savings per thermostat) based on a residential study from RLW Analytics (2007), "Validating the Impact of Programmable Thermostats." After adjusting the billing analysis, the evaluation team produced a revised savings estimate of 130.9 therms per year per programmable thermostat, with a standard error of 108.2 therms.
- However, due to technical concerns raised about the appropriateness of the billing analysis modifications as well as the large standard errors, and the insufficient time with which to discuss them and properly vet any new results, the evaluation team reduced the deemed savings to 32 therms per year per programmable thermostats for the time being, to be consistent with the current residential PT savings value. The evaluation team, PAs, and EEAC consultants agreed that additional billing analysis, including 2014 billing data, would be beneficial to the evaluation. Therefore, DNV GL will work with the PAs to set up an additional billing analysis to help gain more clarity on these results.

Core Initiatives to which the Results of the Study Apply:

- C&I Retrofit: Existing Building (Gas Only)
- C&I Retrofit: Small Business (Gas Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Perform analysis on the 2014 program data, which is currently underway. Knowing the details of PT measure growth or waning, the quantity of PTs installed, program savings, and the delivery method that was employed for each project will provide guidance to identify the optimal next steps.

Recommendation 2: Undertake a second participant survey that is focused on the 2014 program participants to identify and examine important consistencies, variances, and changes between the 2013 and 2014 program years, as well as to clarify the use of PTs, the pre-installed condition, and the savings.

Recommendation 3: Conduct a billing analysis using data from both the 2013 and 2014 program years to increase the precision of the savings estimates results from a future billing analysis.

Recommendation 4: Consider modifications to the billing analysis that would better account for exogenous change in the participant population such as including a matched sample of small businesses, and collecting some additional business-level information in the survey (e.g., hours worked by or paid to employees).

Recommendation 5: Given the inherent difficulties of billing analyses, continue to investigate methods to better quantify the savings achieved by PT installations, such as pre/post PT installation metering.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs have adopted the deemed savings value of 32 therms per year per programmable thermostats for the time being, until the analysis of the 2014 program (and if initiated, 2014 billing) data is complete.

The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The study produced an interim savings value that decreases the prescriptive programmable thermostat savings projected in this 3-Year plan in comparison to prior program years.

Overview of Study Method:

DNV GL conducted three major tasks as part of this study:

- Participant survey: C&I customers that received incentives in 2013 for prescriptive PT's were surveyed to understand their PT use/program delivery method, pre-existing condition, interactive effects, and suitability to participate in a billing analysis.
- Site visits: The evaluation team conducted in-person site visits at 37 selected survey participants' facilities in order to collect more in-depth information and to

verify that information from the survey responses was accurate. The site visits were also used to further screen facilities to determine whether a billing analysis of that facility would likely provide conclusive or inconclusive PT savings results.

- Billing analysis: The evaluation team performed a billing analysis with the goal of identifying a deemed savings value with sufficient confidence to integrate in the Massachusetts TRM. In contrast to the conventional billing analysis that is performed over a large population, the analytical approach focused on a sample of 91 accounts that were identified as “suitable for a billing analysis” by the survey and site visits, and by the availability of sufficient billing data in the pre- and post-program periods.

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 20.

Study 21: Impact Evaluation of PY2013 Custom Gas Installations

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 10/7/2015

Study Objective and Summary of Results:

The primary mission of the study was to determine program realization rates. There was also a secondary objective to further test the efficacy of using a novel process, called "desk review benchmarking" (DRB), which uses structured desk reviews to identify significant changes to program processes.

The study provides the following key findings:

- The study produced statewide results for realization rates that are reliable (±9.5% precision) at 80% confidence. In addition, the precision level for Eversource (±14.2%), National Grid (±19.0%), and Columbia Gas (±21.0) are sufficient to warrant application of their individual PA realization rates.
- The results of the DRB test were not strong enough to warrant its adoption as the primary determinant of impact evaluation timing.

Core Initiatives to which the Results of the Study Apply:

- C&I Retrofit: Existing Building (Gas Only)
- C&I New Construction: New Buildings & Major Renovations (Gas Only)
- C&I New Construction: Initial Purchase & End of Useful Life (Gas Only)
- C&I Retrofit: C&I Multi-Family (Gas Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Realization rates should be utilized for the purposes of planning and reporting as follows: Eversource (91.8%), National Grid (77.9%), Columbia Gas (72.7%) and statewide (88.3%).

Recommendation 2: A single guidance document that codifies the various protocols, principles, and practices used for applying realization rates across all programs, both gas and electric, in all sectors, should be developed as a common reference and to minimize ambiguity. The November 2010 Protocol Memo presents a framework for deciding whether to apply PA-specific, state-wide, or measure specific realization rates for custom gas evaluation results. However, the rules guiding the application of realization rates are not limited to a single program.

Recommendation 3: Follow the recommendation of the "Massachusetts 2013 Prescriptive Gas Impact Evaluation Steam Trap Evaluation Phase I" to commence with a Phase II activity to standardize algorithms. A variety of steam trap tools were used by applicants, some with unsupported assumptions. Steam traps may also be moved to an upstream program delivery model; savings estimates for the upstream model should be coordinated with Phase II outcomes as well.

Recommendation 4: Further explore the role of the DRB method in impact evaluation planning, as future impact evaluations may benefit from a structured data collection of the M&V sample for ongoing measurement of program characteristics.

Recommendation 5: Comprehensive Design Analysis (CDA) natural gas tracking savings included the interactive gas penalty from electric measures. The electric measure penalties should be reported as a resource penalty to the electric program and not reported as a gas program penalty.

Recommendation 6: The application reviewers should cross-check the fraction of the natural gas bills a project is expected to save against typical savings fractions, particularly those that are high.

Recommendation 7: Confirm existing condition ventilation rates and the efficient operation of the installed equipment, given the erratic and often poor savings rates of ventilation control measures (including ventilation heat recovery, demand controlled ventilation [DCV], and ventilation related EMS measures). The additional engineering effort would not be an easy or inexpensive task. However, without further engineering, these types of measures add risk to the portfolio and could expose customers to potentially higher bills than anticipated in cases where the pre-condition did not meet code ventilation requirements. Further research into potential solutions and their impact on installed cost and cost-effectiveness is recommended.

Recommendation 8: The PAs should be diligent in gathering the technical assistance studies, spreadsheets, and models used to develop the project and include them in the electronic documentation, given that the application files are not always complete and sometimes miss significant information. Particular attention should be paid to the documentation of baseline conditions.

Recommendation 9: Consider evaluating projects consisting of only deemed measures with deemed savings as part of technology specific evaluations. In this cycle, there were a number of sites that consisted of deemed measures only using deemed savings estimates (steam trap, low-flow devices, insulation/air-sealing, and programmable thermostats). These sites were predominantly multifamily projects. While the PAs may wish to include the projects in the custom track for administrative reasons, they are most appropriately evaluated in a technology specific evaluation (i.e. a low flow device impact evaluation). These measures do not lend themselves to metering which is the mainstay of a custom evaluation.

Recommendation 10: An error ratio of 0.60 is recommended for future evaluations.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs have adopted the revised realization rates. The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The study produced realization rates that affect program gross savings. The changes in the RR from the previous impact realization are: Eversource (increase in RR from 84% to 91.8%), National Grid (increase in RR from 68% to 77.9%), Columbia Gas (decrease in RR from 83% to 72.7%) and statewide (increase in RR from 82% to 88.3%).

Overview of Study Method:

The study determined gross realization rate through on-site M&V at a statistically selected sample of forty-six PY2013 participating sites. The DRB consisted of desk reviews of ninety-four PY2013 projects using a structured data collection process that characterized the savings estimate and other aspects of the project. The desk reviews included a billing analysis and an engineering assessment of the savings. The PY2013 reviews were compared to benchmarks established by examining PY2009, PY2010, and PY2011 M&V impact evaluation sites using the same structured review.

Application of Results: Retroactively and Prospectively

A copy of the complete study can be found in Appendix U, Study 21.

Study 22: Massachusetts Commercial New Construction Energy Code Compliance Follow-up Study

Type of Study: Market Assessment
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 7/22/2015

Study Objective and Summary of Results:

The purpose of this study was to assess compliance with the Massachusetts energy code by reviewing construction documentation and conducting field visits at 50 active construction sites throughout Massachusetts.

The study provides the following key findings:

- Energy code compliance for MA (using MA-CIEC methodology) was observed to be approximately 94%, suggesting that the state has met the ARRA requirement to achieve 90% compliance by 2017. Compliance using the DOE/PNNL methodology was 85%.
- Code compliance increases near the end of energy code cycles as the design and building communities and code officials become more familiar with the requirements and compliance approaches.
- Code determinations are most often made during the design phase of a commercial project. The primary on-site focus is executing the project as designed and documented.
- Daylighting provisions, introduced for MA in IECC 2009, are not yet being properly implemented in about 50% of the project sites.
- Increased adoption of the MA Stretch Code may have led to increased energy code compliance as designers and builders are increasingly aware of its Code requirements.

Core Initiatives to which the Results of the Study Apply:

- C&I New Construction: New Buildings & Major Renovations (Electric & Gas)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: Adopt modified code baselines that reflect standard practices as the basis for determining energy efficiency incentives.

Recommendation 2: Promote a focus on installation quality to realize greater savings from energy efficiency.

Recommendation 3: Promote high-performance building strategies to achieve additional energy savings.

Recommendation 4: Target code training at specific provisions to achieve additional savings from improved compliance.

Recommendation 5: Streamline future code compliance studies to enable more frequent, cost-effective compliance assessments.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are considering all recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

This study informs program design and planning by providing an assessment of current compliance with the MA energy code as well as offering recommendations to achieve greater energy savings (e.g., focus on advanced building performance strategies) and more frequent, cost-effective compliance assessments (e.g., focus on construction document review).

Overview of Study Method:

This study assessed compliance with the Massachusetts energy code by reviewing construction documentation and conducting field visits for 50 active construction sites throughout Massachusetts. The project team developed stratified, random samples for large (greater than or equal to 50,000 sq ft) and small buildings (less than 50,000 sq ft) from McGraw-Hill Construction's Dodge Global Network (Dodge Database) that were actively under construction from June 2014 through February 2015. The drawn sample included 25 large sites and 25 small sites and was expected to meet a 90/10 confidence/precision target.

For each site, the evaluators obtained a copy of the most current construction design documents and conducted a review of this documentation for energy code compliance. Following the documentation review, evaluators scheduled field visits for each site to confirm what was observed on the construction documents and fill in any gaps in information. For some of the large sites, the evaluators conducted multiple site visits to observe energy code components throughout the construction process.

Following the field visits, the evaluators developed a code compliance score for each site based on observed code provisions weighted by their relative energy impact. The evaluators evaluated each site using two different methodologies: one developed by the Department of Energy (DOE) in conjunction with the Pacific Northwest National

Laboratory (PNNL) (the DOE/PNNL methodology) and an enhanced methodology developed by the evaluation team to more accurately capture the energy impact of observed building practices (MA-CIEC methodology).

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 22.

Study 23: Massachusetts LED Spillover Analysis

Type of Study: Market Assessment
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 9/24/2015

Study Objective and Summary of Results:

The purpose of this study was to assess the potential spillover savings associated with the LED lighting programs offered by the PAs in light of recent findings from the LED Market Effects Baseline Characterization study that showed high levels of C&I customer adoption.

More specifically, this study sought to:

- Further investigate causes of the higher rate of LED adoption observed in Massachusetts C&I customers
- Estimate spillover and free-ridership associated with PA programs that support C&I LED products
- Research other key market elements, such as factors influencing the purchase of LED products, changes in supplier activities to promote LEDs, and processes by which customer decide to purchase lighting

The study provides the following key findings:

- C&I LED NTG of 1.42
- Indicators of strong LED market development:
    - The sample participants reported that the program primarily influenced the timing and quantity of their LED purchases. Eighty-two percent would have purchased LEDs for replacement without the program, highlighting the influence of the program on expediting and increasing these planned purchases
    - The majority of customers noted that the level of vendors' promotions of LED products has increased over the last two years
    - Over 70% of customers purchase LED lamps through distributors and contractors
- Indicators of strong effects of prior program participation
    - Sixty percent of participants noted that prior program experience had influenced their decision to purchase out-of-program LEDs
    - Almost all customers noted that past programs made them more comfortable and aware of the benefits associated with energy efficiency

Core Initiatives to which the Results of the Study Apply:

- C&I Retrofit: Upstream Lighting (electric) (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

> **Recommendation 1:** The PAs should take steps to ensure that smaller customers are exposed to opportunities to purchase incented LED lamps through Direct Install programs and strong promotions via large home improvement stores and electronics retailers.

> **Recommendation 2:** Focus program efforts on the promotion of LED linear fixtures, which account for a very high portion (roughly 80 percent) of total commercial lighting energy consumption currently. Sales of LED linear equipment continue to be low, but significant reductions in price are forecasted over the next 5 years.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs are adopting the NTG ratio of 1.42 developed in this study for upstream C&I non-linear LED lighting. The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The study produced a NTG ratio that is higher than the overall NTG value for LED lighting products and commercial lighting that is currently being applied. The PAs are applying the updated NTG ratio to estimate the savings for Upstream C&I non-linear LED lighting projected in this Plan.

Overview of Study Method:

The DNV GL team conducted a survey of customers (99 of 144 possible respondents, for a response rate of 73%) to estimate free-ridership and spillover for LED products supported by the PAs' programs, using the methods and survey questions developed as part of the Cross-Cutting evaluation portfolio.[7] Specifically, the evaluation team surveyed on-site respondents from Wave I of the Massachusetts Commercial and Industrial Customer On-Site Assessments with verified LEDs to ensure a relatively more accurate inventory of LED holdings.

[7] Tetra Tech. 2011. *2010 Commercial and Industrial Electric Programs Free-ridership and Spillover Study.*

To estimate free-ridership and spillover for each survey respondent, the evaluation team developed in and out of program LED savings for each account using data from three distinct data sources:

- **On-site data collected in the fall of 2014.** DNV GL engineers verified that 144 sites surveyed as part of the first wave of the Massachusetts Commercial and Industrial Customer On-Site Assessment Study contained interior LED lighting products.
- **2011-14 Customer & Industrial Customer Tracking Data, including prescriptive, custom, and new construction program tracking data**
- **2012-14 Upstream Data**

For the purposes of estimating these free-ridership, participant spillover, and non-participant spillover, the evaluation team treated participants and non-participants as separate populations. Free-ridership and participant spillover were calculated as ratios of the sampled LED savings characterized as free-rider or spillover savings to total sampled LED savings (Equation 1 and Equation 2). Non-participant spillover, on the other hand, was estimated in comparison to total program LED savings from the 2011-14 tracking data in order to represent non-participant savings from the total population of C&I customers (Equation 3).

Equation 1: Free-Ridership Calculation

$$\frac{\sum(\textbf{Free Rider Rate } \boldsymbol{i} * \textbf{Site Weight } \boldsymbol{i} * \textbf{Program LED Savings } \boldsymbol{i})}{\sum(\textbf{Site Weight } \boldsymbol{i} * \textbf{Program LED Savings } \boldsymbol{i})}$$

Equation 2: Participant Spillover Calculation

$$\frac{\sum(\textbf{Participant Spillover Rate } \boldsymbol{i} * \textbf{Site Weight } \boldsymbol{i} * \textbf{Out} - \textbf{of} - \textbf{Program LED Savings } \boldsymbol{i})}{\sum(\textbf{Site Weight } \boldsymbol{i} * \textbf{Out} - \textbf{of} - \textbf{Program LED Savings } \boldsymbol{i})}$$

Equation 3: Non-Participant Spillover Calculation

$$\frac{\sum(\textbf{Non} - \textbf{Participant Spillover Rate } \boldsymbol{i} * \textbf{Site Weight } \boldsymbol{i} * \textbf{Site} - \textbf{level LED Savings } \boldsymbol{i})}{\textbf{Total } \mathbf{2011 - 2014} \textbf{ LED Program Savings}}$$

Application of Results: Prospectively

A copy of the complete study can be found in Appendix U, Study 23.

Study 24: Impact Evaluation of Prescriptive Chiller and Compressed Air Installations

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 10/22/2015

Study Objective and Summary of Results:

The purpose of this study was to verify and re-estimate gross energy and demand savings through site specific inspection, monitoring and analysis. The retrospective results of this study will be used to determine the final realization rates for Prescriptive CAIR and HE Chiller energy efficiency measures installed in 2015. Realization rates for both measures were determined at the statewide level, while HE Chiller results are also provided for Eversource-NSTAR separately due to the differences in methods of tracking savings calculations. In addition to producing retrospective results, the impact evaluation provides prospective deemed savings estimates, savings algorithms and/or savings factors (such as ELFH) to be used to inform future savings estimates.

The study provides the following key findings:

- Savings from new prescriptive chillers have a retrospective energy savings realization rate of 104% at the state level. For the larger PAs, energy savings realization rates were also positive with National Grid at 127% and Eversource-NSTAR at 100%. These realization rates were driven by two factors, namely increased delta efficiency and an increase in EFLH. In addition, it appears that the TRM methodology underestimated savings while the Eversource-NSTAR tool was more accurate.
- Savings from all three prescriptive compressed air measures (air compressors, refrigerated air dryers, and zero loss condensate drains) are being realized.
    - The air compressor measure produced a retrospective energy savings realization rate of 109%. This value was driven by VSD air compressors, which performed much better (113%) than the load/unload air compressors (19%). However, it should be noted that there were only three load/unload air compressors in the sample and those may be considered as the baseline going forward. The high VSD compressor realization rates were primarily the result of higher than anticipated operating hours.
    - The study also suggests using load/unload air compressors as the baseline technology for high efficiency air compressors going forward instead of the current modulating with blowdown baseline. Compressor results are provided for both baseline scenarios.
    - The dryer measure yielded a retrospective energy savings realization rate of 257%, which was driven by both a higher average kW reduction per CFM, and higher operating hours. The largest savings increase came from

the largest dryer category (>400 CFM). This dryer category included five dryers, which were all part of compressed air systems that operated 24/7.

- The zero loss condensate drains appear to be installed as expected. Though this equipment was not monitored, evaluators verified the installation of almost all drains that were incentivized. It was recommended that no savings adjustments be made to this measure.

Core Initiatives to which the Results of the Study Apply:

- C&I New Construction: New Buildings & Major Renovations (Electric Only)
- C&I New Construction: Initial Purchase & End of Useful Life (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommendation 1: The retrospective realization rates for chillers produced in this study are intended to be used by all PAs for their 2015 projects. This evaluation recommends that Eversource-NSTAR utilize its own PA specific retrospective realization rates, and that all remaining PAs use the TRM user retrospective realization rates.

The new savings factors and prospective realization rates for chillers produced by this study, which are calculated based on the average operating kW of the sample of chillers, may be used to update the values from the TRM. If applied, they should not be combined with the retrospective realization rates.

Recommendation 2: Consider more research around the key finding that many chillers operate at very low part loads (i.e., not cycling, and therefore operating below the manufacturer-recommended part load values), particularly the implications for reliability, efficiency, and energy savings.

Recommendation 3: Consider a closer review of chiller project applications, ensuring that more complicated projects, like those with multiple chillers or chillers used for data center cooling, go through the custom track.

Recommendation 4: Encourage vendors to look for additional chiller savings opportunities such as changing control set points (e.g., lower condenser water temperature, higher chilled water temperature or chilled water temperature reset). These types of improvements are covered by the custom program, and may result in moving some prescriptive projects to the custom track.

Recommendation 5: Update the air compressor baseline from the current modulating with blowdown to load/unload, even though the savings calculated from these two different baselines did not vary significantly. A recent incremental cost study found that the cost of a modulating air compressor is nearly the same as a load/unload air compressor, and that the load/unload air compressor is now considered the baseline compressor. The results of this study show that the savings opportunities from going from a modulating to load/unload system are minimal except at higher storage levels for the load/unload unit.

Recommendation 6: The retrospective realization rates for air compressors produced in this study are intended to be used by all PAs for their 2015 projects.

The new prospective savings factors for air compressors and refrigerated dryers produced by this study may be used to update the values in the TRM. If applied, they should not be combined with the retrospective realization rates. Should the program switch to a load/unload baseline, the TRM should use the set of values calculated from this baseline condition.

Recommendation 7: Recommend that compressed air vendors conduct simple short term metering to better understand their operation during off-shift periods and help improve the accuracy of the annual hours of operation.

Recommendation 8: Consider a review of interval load data prior to finalizing applications, given that in many cases the actual operating hours were observed to be significantly higher, resulting in unclaimed savings. For applications with relatively low operating hours (<~4,000 hrs/yr), it may be worthwhile to perform a brief interval load data review to confirm actual plant operating hours since compressors are often a significant percentage of a facility's energy consumption and operation.

Recommendation 9: Encourage vendors to look for additional compressed air savings opportunities such as lowering the discharge pressure, and inspecting for and reducing air leaks. These types of improvements are covered by the custom program, and may result in moving some prescriptive air compressor projects to custom.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs have adopted the revised retrospective and prospective realization rates and savings factors produced in this study as well as the updated compressor baseline. The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations.

How the Study Affected Program Results:

The study produced realization rates and savings factors that increase the estimated gross savings projected in this 3-Year plan for chillers in comparison to prior program years. It also increases the estimated savings for VSD air compressors and air dryers.

Overview of Study Method:

DNV GL conducted the following steps:

- Examined the population of prescriptive chiller and compressed air measures statewide so that the PAs can better understand their characteristics;
- Designed an efficient sampling plan for the selection of prescriptive chiller and compressed air participants for on-site visits, and to optimize to the extent possible energy savings estimate results with ±10% precision at the 90% confidence interval for all selected end uses at the statewide level;
- Developed a project work plan outlining the major approaches and foreseeable research issues of this impact evaluation effort;
- Reviewed the formulas, calculations, and factors used in the development of the tracking savings for each sampled participant to develop measure specific M&V plans;
- Performed comprehensive data collection at each sample site to support an independent analysis of adjusted gross energy and demand savings realization rates; and
- Produced comprehensive reporting of results, including analysis methods, findings and trends, final sample plans and data collection instruments used.

Application of Results: Retroactively and Prospectively

A copy of the complete study can be found in Appendix U, Study 24.

Study 25: Impact Evaluation of 2012 Custom HVAC Installations

Type of Study: Impact Evaluation
Evaluation Conducted by: DNV GL
Date Evaluation Conducted: 10/23/2015

Study Objective and Summary of Results:

The purpose of this study was to verify or re-estimate the electric energy and demand savings estimates for 69 Custom HVAC projects through site-specific inspection, monitoring, and analysis. The results of this study will be used to determine the final realization rates for Custom HVAC energy efficiency measures installed in 2015 and for 2016-2018 program planning. Realization rates were separately determined for Cape Light Compact, Eversource (NSTAR and WMECo separately), National Grid and Unitil, as well as at the statewide level.

The study provides the following key findings:

- The study produced a statewide energy realization rate of 88% that is reliable (±7.4%) at 90% confidence. In addition, the precision level for Eversource-NSTAR (±9.4%) and National Grid (±8.8) are sufficient to warrant application of their individual PA realization rates of 91% and 75%, respectively.
- The study produced statewide summer and winter on-peak and seasonal peak kW savings realization rates.
    - Summer on-peak: 88% realization rate with a precision of ±12.6% at 80% confidence.
    - Winter on-peak: 85% realization rate with a precision of ±13.1% at 80% confidence.
    - Summer seasonal: 87% realization rate with a precision of ±17.1% at 80% confidence.
    - Winter seasonal: 85% realization rate with a precision of ±16.6% at 80% confidence.
- The study produced Eversource-NSTAR summer and winter on-peak savings realization rates.
    - Summer on-peak: 94% realization rate with a precision of ±15.3% at 80% confidence.
    - Winter on-peak: 88% realization rate with a precision of ±16.1% at 80% confidence.
- The study produced National Grid summer and winter on-peak savings realization rates.
    - Summer on-peak: 70% realization rate with a precision of ±18.7% at 80% confidence.
    - Winter on-peak: 67% realization rate with a precision of ±16.7% at 80% confidence.

Core Initiatives to which the Results of the Study Apply:

- C&I New Construction: New Buildings & Major Renovations (Electric Only)
- C&I Retrofit: Existing Building (Electric Only)
- C&I Retrofit: C&I Multi-Family (Electric Only)
- C&I New Construction: Initial Purchase & End of Useful Life (Electric Only)

Evaluation Recommendations:

The following recommendations were made by the evaluators conducting this study.

Recommandation 1: Improve Baseline or Pre-Retrofit Documentation. Several sites did not clearly document the pre-retrofit equipment operation or the basis for the base case in their project applications. The supporting documentation and baseline assumptions provided for HVAC control measures, such as ventilation control measures, economizers, and other controls were not as comprehensive and clear as with other technologies. It is recommended that the PAs collect and document information on the actual HVAC system operations such as damper positions, outside air ventilation levels, etc. for existing equipment undergoing controls improvements.

Recommendation 2: Provide Sufficient Documentation. Comprehensive documentation, meaning working savings calculation files and thorough explanation of baseline and installed case assumptions, is essential for supporting baseline conditions and detailed calculations as well as for evaluation purposes. Missing information, such as building simulation input files and working custom savings spreadsheets, should be included in the PA files.

Recommendation 3: Clearly Document Calculations of Peak Demand Savings. It is recommended that vendors provide full and clear documentation of peak savings calculations, including how peak demand savings are estimated (e.g., source or logic of the weighted operational proportions).

Recommendation 4: Encourage More Comprehensive Commissioning and Updating of Tracking Estimates with Findings from Commissioning. Commissioning is a useful tool to help improve savings estimates for HVAC controls projects. While all PAs currently use commissioning in some capacity, there are areas where this tool can be improved. First, PAs should consider employing a commissioning process on any large or complex project and particularly those with controls measures. Additionally, PAs should continue to follow-up on projects that are commissioned to ensure that the project and savings calculation has been done in accordance with the design intent, and that any savings calculation adjustments resulting from commissioning are made to the final tracking estimates.

Recommendation 5: Conduct Pre-Installation Metering for More Retrofit Projects. Short term pre-installation metering could be used to confirm assumptions about pre-existing equipment for some retrofit projects, particularly control type projects. The evaluator may not be able to simulate pre-retrofit operating conditions; therefore metering by the implementation vendor prior to installation could improve confidence in the pre-retrofit assumptions. This would be most useful for demand control ventilation or other controls type projects.

Recommendation 6: Improve use of Post Inspection to Verify Measure Operation. Evaluators identified a number of sites in which the controls or equipment installed were not operational. Post inspections are generally occurring on all custom projects, but the effectiveness of the post inspection could be improved by observing and documenting operating conditions at the time of the inspection rather than only verifying if the measure was installed. Evaluators have observed some improvement in operational effectiveness because of post installation screening in more recent custom impact evaluations, as compared to studies from five years ago. It is recommended that the PAs continue to use more rigorous post-installation inspections to further build on the efforts made in this area.

Recommendation 7: Require Trend Data Acquisition. Stipulate in customer participation agreements that for sites receiving controls measures, either customer staff are to be trained or the controls contractor will be required to assist with subsequent EMS trending in the event the customer is chosen as an evaluation site. It would be helpful to include in the contract specifically which trends should be made available to the PA and evaluators for evaluation. The engineers developing the project scopes could specify the required trends. Consider the feasibility of configuring controls systems to allow remote access by evaluators to allow for data downloads.

Recommendation 8: Use of Desk Review Methodology. A recent MA custom gas evaluation performed desk reviews on a double sample of custom gas projects.[8] This was set up as a test to determine if a desk review process could predict changes in realization rates that would trigger an impact evaluation. The evaluators concluded that the results of the test were not strong enough to warrant adoption of this process as the primary means of determining when to conduct an impact evaluation. However, future impact evaluations, including custom HVAC, may benefit from a structured desk review of key parameters from the M&V sample for ongoing monitoring of program characteristics. An interesting option is to use the structured desk review on a rolling sample for the purpose of providing ongoing program implementation feedback and as well as a continuous indication of program change that could be reviewed as part of the annual evaluation planning. A continuous desk review process would characterize some program change indicators, including quality of engineering calculations and baselines used to estimate savings. The PAs have commissioned a study to improve evaluation planning, where the desk review role in impact evaluation can be further considered.

[8] Energy & Resource Solutions and DNV GL, Project 43 Impact Evaluation of PY2013 Custom Gas Installations, September 2015

Recommendation 9: Consider Other Evaluation Methodologies. Given that this impact evaluation of custom HVAC installations took over two years to complete, the evaluation team should investigate alternative options to evaluate large, influential measures such as custom HVAC. Ideas, including a rolling annual sample, are currently being discussed as part of a new effort to refine the gross impact evaluation framework.

Explain Whether or Not the PAs Decided to Adopt the Recommendations from the Study:

The PAs have adopted the revised realization rates produced in this study. The PAs are considering the other recommendations for adoption at this time. The PAs have not formally adopted or rejected any recommendations that require changes to program design and operations

How the Study Affected Program Results:

The study produced realization rates that decrease the gross savings projected in the 3-Year plan in comparison to prior program years.

Overview of Study Method:

The evaluation of 2012 custom HVAC installations used an approach similar to those of previous evaluations. The primary objective of determining realization rates at the statewide and PA end-use level was accomplished by conducting on-site M&V at a statistically selected sample of 69 participant sites from the 2012 program year. This impact study consists of the following five tasks:

- Develop sample design.
- Develop site measurement and evaluation plans.
- On-site data gathering and site analysis.
- Site report writing and follow-up.
- Expansion analysis and evaluation report.

Application of Results: Retroactively and Prospectively

A copy of the complete study can be found in Appendix U, Study 25.

V. **Technical Reference Manual**

Massachusetts
Technical Reference Manual

for Estimating Savings from Energy Efficiency Measures

2016-2018 Program Years – Plan Version

October 2015

Table of Contents

Introduction

This *Massachusetts Technical Reference Manual for Estimating Savings from Energy Efficiency Measures* ("TRM") documents for regulatory agencies, customers, and other stakeholders how the energy efficiency Program Administrators ("PAs") consistently, reliably, and transparently calculate savings from the installation of efficient equipment, collectively called "measures." This reference manual provides methods, formulas and default assumptions for estimating energy, peak demand and other resource impacts from efficiency measures.

Within this TRM, efficiency measures are organized by the sector for which the measure is eligible and by the primary energy source associated with the measure. The two sectors are Residential and Commercial & Industrial ("C&I").[1] The primary energy sources addressed in this TRM are electricity and natural gas.

Each measure is presented in its own section as a "measure characterization." The measure characterizations provide mathematical equations for determining savings (algorithms), as well as default assumptions and sources, where applicable. In addition, any descriptions of calculation methods or baselines are provided as appropriate. The parameters for calculating savings are listed in the same order for each measure.

Algorithms are provided for estimating annual energy and peak demand impacts for primary and secondary energy sources if appropriate. In addition, algorithms or calculated results may be provided for other non-energy impacts (such as water savings or operation and maintenance cost savings). Data assumptions are based on Massachusetts PA data where available. Where Massachusetts-specific data is not available, assumptions may be based on, 1) manufacturer and industry data, 2) a combination of the best available data from jurisdictions in the same region, or 3) credible and realistic factors developed using engineering judgment.

The TRM will be reviewed and updated annually to reflect changes in technology, baselines and evaluation results.

[1] In this document, the Residential and Low Income programs are represented in a single "Residential" sector due to the degree of overlap in savings assumptions for similar measures in the standard income programs.

TRM Update Process

Overview

This section describes the process for updating the TRM. The update process is synchronized with the filing of program plans and Plan Year Reports by the PAs with the DPU.

Updates to the TRM can include:

- additions of new measures,
- updates to existing TRM measures due to:
  - changes in baseline equipment or practices, affecting measure savings
  - changes in efficient equipment or practices, affecting measure savings
  - changes to deemed savings due the revised assumptions for algorithm parameter values (e.g., due to new market research or evaluation studies)
  - other similar types of changes,
- updates to impact factors (e.g., due to new impact evaluation studies),
- discontinuance of existing TRM measures, and
- updates to the glossary and other background material included in the TRM.

Each TRM is associated with a specific program year, which corresponds to the calendar year. This results in two main versions of the TRM for each program year:

- the "Plan Version" is filed with the PA program plans prior to the program year, and
- the "Report Version" includes updates to the "Plan Version" document as needed and is filed with the PA Plan Year Reports, with the final savings algorithms and factors used to report actual savings.

The TRM for each program year is updated over time as needed to both plan for future program savings and to report actual savings.

Key Stakeholders and Responsibilities

Key stakeholders and their responsibilities for the TRM updates are detailed in the following table.

Stakeholder	Responsibilities
TRM Coordinating Committee	▪ Administrative coordination of TRM activities, including: ▪ Assure collaboration and consensus by the PAs regarding TRM updates ▪ Assure updates are compiled from the PAs and incorporated into the TRM ▪ Coordinate with related program activities (e.g., evaluation and program reporting processes)
Program Administrators	▪ Provide one or two representatives each to the TRM Coordinating Committee, either by direct representation or through a proxy (e.g., GasNetworks). Both the planning and evaluation functions should be represented on the Committee. ▪ Identify needed updates to the TRM ▪ Coordinate with other PAs on all TRM updates ▪ File TRM updates with the DPU

Stakeholder	Responsibilities
Department of Energy Resources	▪ Provide one representative to the TRM Coordinating Committee ▪ Assure coordination with PA submissions of program plans and reported savings

TRM Update Cycle

The timeline below shows the main milestones of the TRM update cycle over a period of two years. The milestones for the program year ("PY") 2016-2018 TRM Plan and Report versions are described below the timeline.

OCTOBER 2015: The 2016-2018 PY – Plan Version TRM is filed with the PAs' program plans.

The 2016-2018 Program Year – Plan Version TRM is filed with the DPU jointly with the PAs' energy efficiency program plans. With regard to the program plans, the TRM is considered a "planning document" in that it provides the documentation for how the PAs *plan* to count savings for that program year. The TRM is not intended to fully document how the PAs develop their plan estimates for savings.

OCTOBER 2015 - JUNE 2017: The 2016 Program Year TRM will be updated as needed based on evaluation studies and any other updates that will affect reported savings for PY 2016.

After the 2016-2018 Program Year – Plan Version TRM has been filed, there may be updates to the TRM to reflect how savings are actually calculated for PY 2016. The most common updates to the TRM will result from new evaluation studies. Results of evaluation studies will be integrated into the working version of the TRM as the studies are completed. Other updates may include the results of working group discussions to achieve greater consistency among PA assumptions.

JANUARY 2016: PAs begin to track savings based on the 2016-2018 TRM

Beginning in January 2016, the PAs will track savings for PY 2016-2018 based on the 2016-2018 Program Year – Plan Version TRM.

JUNE 2017: The 2016 Program Year – Report Version TRM will be filed with the PY 2016 Plan Year Reports

The 2016 Program Year – Report Version TRM, including any updates relative to the Program Plan version, will be filed with the PAs' Plan Year Reports. Updates from the Plan Version may include new evaluation results or changes based on working group discussions, and will be clearly identified in the Report Version

Measure Characterization Structure

This section describes the common entries or inputs that make up each measure characterization. A formatted template follows the descriptions of each section of the measure characterization.

Source citations: The source of each assumption or default parameter value should be properly referenced in a footnote. New source citations should be added to Appendix D: Table of Referenced Documents, which serves as a cross-reference to digital versions of the referenced documents.

Measure Name

A single device or behavior may be analyzed as a range of measures depending on a variety of factors which largely translate to where it is and who is using it. Such factors include hours of use, location, and baseline (equipment replaced or behavior modified). For example, the same screw-in compact fluorescent lamp will produce different savings if installed in an emergency room waiting area than if installed in a bedside lamp.

Version Date and Revision History

This section will include information regarding the history of the measure entry including when the data for that measure is effective, and the last date that the measure is offered.

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

This section will include a plain text description of the efficient and baseline technology and the benefit(s) of its installation, as well as subfields of supporting information including:

Description: <Description of the energy efficiency measure>
Primary Energy Impact: < Natural Gas, Propane, Oil, Electric >
Secondary Energy Impact: <e.g., Natural Gas, Propane, Oil, Electric, None>
Non-Energy Impact: <e.g., Water Resource, O&M, Non-Resource, None>
Sector: <Residential, Low Income or Commercial and Industrial>
Market: <Lost Opportunity, Retrofit and/or Products and Services>
End-Use: <Per ISO-NE efficiency reporting tool – see list below>
Core Initiative: <Per PA definition>

End-Uses:

Lighting	Compressed Air	Energy Star Homes
HVAC	Behavior	Home Energy Services
Motors /Drives	Envelope	Process
Refrigeration	Custom Measures	Food Service
Hot Water		

Notes

This is an optional section for additional notes regarding anticipated changes going forward. For example, this section would not if there were upcoming statewide evaluations affecting the measure, or any plans for development of statewide tool for calculating measure savings.

Algorithms for Calculating Primary Energy Impacts

This section will describe the method for calculating the primary energy savings in appropriate units, i.e., kWh for electric energy savings or MMBtu for natural gas energy savings. The savings algorithm will be provided in a form similar to the following:

$$\Delta kWh = \Delta kW \times Hours$$

Similarly, the method for calculating electric demand savings will be provided in a form similar to the following:

$$\Delta kW = \left(Watts_{BASE} - Watts_{EE}\right)/1000$$

Below the savings algorithms, a table contains the definitions (and, in some cases, default values) of each input in the equation(s). The inputs for a particular measure may vary and will be reflected as such in this table (see example below).

ΔkWh	=	gross annual kWh savings from the measure
ΔkW	=	gross connected kW savings from the measure
Hours	=	average hours of use per year
$Watts_{BASE}$	=	baseline connected kW
$Watts_{EE}$	=	energy efficient connected kW

Baseline Efficiency

This section will include a statement of the assumed equipment/operation efficiency in the absence of program intervention. Multiple baselines will be provided as needed, e.g., for different markets. Baselines may refer to reference tables or may be presented as a table for more complex measures.

High Efficiency

This section will describe the high efficiency case from which the energy and demand savings are determined. The high efficiency case may be based on specific details of the measure installation, minimum requirements for inclusion in the program, or an energy efficiency case based on historical participation. It may refer to tables within the measure characterization or in the appendices or efficiency standards set by organizations such as ENERGY STAR® and the Consortium for Energy Efficiency.

Hours

This section will note operating hours for equipment that is either on or off, or equivalent full load hours for technologies that operate at partial loads, or reduced hours for controls. Reference tables will be used as needed to avoid repetitive entries.

Measure Life

Measure Life includes equipment life and the effects of measure persistence. Equipment life is the number of years that a measure is installed and will operate until failure. Measure persistence takes into account business turnover, early retirement of installed equipment, and other reasons measures might be removed or discontinued.

Secondary Energy Impacts

This section described any secondary energy impacts associated with the energy efficiency measure, including all assumptions and the method of calculation.

Non-Energy Impacts

This section describes any non-energy impacts associated with the energy efficiency measure, including all assumptions and the method of calculation.

Impact Factors for Calculating Adjusted Gross Savings

The section includes a table of impact factor values for adjusting gross savings. Impact factors for calculating net savings (free ridership, spillover and/or net-to-gross ratio) are Appendix B: Net to Gross Impact Factors. Further descriptions of the impacts factors and the sources on which they are based are described below the table.

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}

Abbreviated program names may be used in the above table. The mapping of full program names to abbreviated names is given below.

	Full Core Initiative Name	Abbreviation
Residential-Electric	Residential New Construction	RNC
	Residential Heating & Cooling Equipment	RHVAC
	Residential Multi-Family Retrofit	MF Retrofit
	Residential Home Energy Services	HES
	Residential Behavior/Feedback Program	Behavior/Feedback
	Residential Lighting	Res Lighting
	Residential Consumer Products	Res Products
Low Income-Electric	Low-Income Single Family Retrofit	LI Retrofit 1-4
	Low-Income Multi-Family Retrofit	LI MF Retrofit
C&I – Electric	C&I New Buildings & Major Renovations	NB
	C&I Initial Purchase & End of Useful Life	EUL
	C&I Existing Building Retrofit	Large Retrofit
	C&I Multifamily Retrofit	C&I MF Retrofit
	C&I Upstream Lighting	Upstream
	C&I Small Business	Small Retrofit
Residential – Gas	Residential New Construction	RNC
	Residential Heating & Cooling Equipment	RHVAC
	Residential Home Energy Services	HES
	Residential Multi-Family Retrofit	MF Retrofit
	Residential Behavior/Feedback	Behavior/Feedback
Low Income – Gas	Low-Income Single Family Retrofit	LI Retrofit 1-4
	Low-Income Multi-Family Retrofit	LI MF Retrofit
C&I - Gas	C&I New Buildings & Major Renovations	NB
	C&I Initial Purchase & End of Useful Life	EUL
	C&I Existing Building Retrofit	Large Retrofit
	C&I Multifamily Retrofit	C&I MF Retrofit
	C&I Small Business	Small Retrofit

Impact Factors for Calculating Adjusted Gross and Net Savings

PAs use the algorithms in the Measure Characterization sections to calculate the gross savings for energy efficiency measures. Impact factors are then applied to make various adjustments to the gross savings estimate to account for the performance of individual measures or energy efficiency programs as a whole in achieving energy reductions as assessed through evaluation studies. Impacts factors address both the technical performance of energy efficiency measures and programs, accounting for the measured energy and demand reductions realized compared to the gross estimated reductions, as well as the programs' effect on the market for energy efficient products and services.

This section describes the types of impact factors used to make such adjustments, and how those impacts are applies to gross savings estimates. Definitions of the impact factors and other terms are also provided in Appendix F: Glossary.

Types of Impact Factors

The impact factors used to adjust savings fall into one of two categories:

Impact factors used to adjust gross savings:

- In-Service Rate ("ISR")
- Realization Rate ("RR")
- Summer and Winter Peak Demand Coincidence Factors ("CF").

Impact factors used to calculate net savings:

- Free-Ridership ("FR") and Spillover ("SO") Rates
- Net-to-Gross Ratios ("NTG").

The **in-service rate** is the actual portion of efficient units that are installed. For example, efficient lamps may have an in-service rate less than 1.00 since some lamps are purchased as replacement units and are not immediately installed. The ISR is 1.00 for most measures.

The **realization rate** is used to adjust the gross savings (as calculated by the savings algorithms) based on impact evaluation studies. The realization rate is equal to the ratio of measure savings developed from an impact evaluation to the estimated measure savings derived from the savings algorithms. The realization rate does not include the effects of any other impact factors. Depending on the impact evaluation study, there may be separate realization rates for energy (kWh), peak demand (kW), or fossil fuel energy (MMBtu).

A **coincidence factor** adjusts the connected load kW savings derived from the savings algorithm. A coincidence factor represents the fraction of the connected load reduction expected to occur at the same time as a particular system peak period. The coincidence factor includes both coincidence and diversity factors combined into one number, thus there is no need for a separate diversity factor in this TRM.

Coincidence factors are provided for both the on-peak and seasonal peak periods as defined by the ISO New England for the Forward Capacity Market ("FCM"), and are calculated consistently with the FCM methodology. Electric demand reduction during the ISO New England peak periods is defined as follows:

On-Peak Definition:

- Summer On-Peak: average demand reduction from 1:00-5:00 PM on non-holiday weekdays in June July, and August
- Winter On-Peak: average demand reduction from 5:00-7:00 PM on non-holiday weekdays in December and January

Seasonal Peak Definition:

- Summer Seasonal Peak: demand reduction when the real-time system hourly load is equal to or greater than 90% of the most recent "50/50" system peak forecast for June-August
- Winter Seasonal Peak: demand reduction when the real-time system hourly load is equal to or greater than 90% of the most recent "50/50" system peak load forecast for December-January.

The values described as Coincidence Factors in the TRM are not always consistent with the strict definition of a Coincidence Factor (CF). It would be more accurate to define the Coincidence Factor as "the value that is multiplied by the Gross kW value to calculate the average kW reduction coincident with the peak periods." A coincidence factor of 1.00 may be used because the coincidence is already included in the estimate of Gross kW; this is often the case when the "Max kW Reduction" is not calculated and instead the "Gross kW" is estimated using the annual kWh reduction estimate and a loadshape model.

A **free-rider** is a customer who participates in an energy efficiency program (and gets an incentive) but who would have installed some or all of the same measure(s) on their own, with no change in timing of the installation, if the program had not been available. The **free-ridership rate** is the percentage of savings attributable to participants who would have installed the measures in the absence of program intervention.

The **spillover rate** is the percentage of savings attributable to a measure or program, but additional to the gross (tracked) savings of a program. Spillover includes the effects of 1) participants in the program who install additional energy efficient measures outside of the program as a result of participating in the program, and 2) non-participants who install or influence the installation of energy efficient measures as a result of being aware of the program. These two components are the **participant spillover** (SO_P) and **non-participant spillover** (SO_{NP}).

The **net savings** value is the final value of savings that is attributable to a measure or program. Net savings differs from gross savings because it includes the effects of the free-ridership and/or spillover rates.

The **net-to-gross** ratio is the ratio of net savings to the gross savings adjusted by any impact factors (i.e., the "adjusted" gross savings). Depending on the evaluation study, the NTG ratio may be determined from the free-ridership and spillover rates, if available, or it may be a distinct value with no separate specification of FR and SO values.

Standard Net–to–Gross Formulas

The TRM measure entries provide algorithms for calculating the gross savings for those efficiency measures. The following standard formulas show how the impact factors are applied to calculate the adjusted gross savings, which in turn are used to calculate the net savings. These are the calculations used by the PAs to track and report gross and net savings. The gross savings reported by the PAs are the unadjusted gross savings without the application of any impact factors.

Calculation of Net Annual Electric Energy Savings

$$adj\_gross\_kWh = gross\_kWh \times RR_E \times ISR$$
$$net\_kWh = adj\_gross\_kWh \times NTG$$

Calculation of Net Summer Electric Peak Demand Coincident kW Savings

$$adj\_gross\_kW_{SP} = gross\_kW \times RR_{SP} \times ISR \times CF_{SP}$$
$$net\_kW_{SP} = adj\_gross\_kW_{SP} \times NTG$$

Calculation of Net Winter Electric Peak Demand Coincident kW Savings

$$adj\_gross\_kW_{WP} = gross\_kW \times RR_{WP} \times ISR \times CF_{WP}$$
$$net\_kW_{WP} = adj\_gross\_kW_{WP} \times NTG$$

Calculation of Net Annual Natural Gas Energy Savings

$$adj\_gross\_MMBtu = gross\_MMBtu \times RR_E \times ISR$$
$$net\_MMbtu = adj\_gross\_MMBtu \times NTG$$

Depending on the evaluation study methodology:

- NTG is equal to $(1 – FR + SO_P + SO_{NP})$, or
- NTG is a single value with no distinction of FR, SO_P, SO_{NP}, and/or other factors that cannot be reliably isolated.

Where:

Gross_kWh	=	Gross Annual kWh Savings
adj_gross_kWh	=	Adjusted Gross Annual kWh Savings
net_kWh	=	Net Annual kWh Savings
$Gross\_kW_{SP}$	=	Gross Connected kW Savings (summer peak)
$adj\_gross\_kW_{SP}$	=	Adjusted Gross Connected kW Savings (summer peak)
$Gross\_kW_{WP}$	=	Gross Connected kW Savings (winter peak)
$adj\_gross\_kW_{WP}$	=	Adjusted Gross Connected kW Savings (summer peak)
net_kW_{SP}	=	Adjusted Gross Connected kW Savings (winter peak)
net_kW_{WP}	=	Net Coincident kW Savings (winter peak)
Gross_MMBtu	=	Gross Annual MMBtu Savings
adj_gross_MMBtu	=	Adjusted Gross Annual MMBtu Savings
net_MMBtu	=	Net Annual MMBtu Savings
ISR	=	In-Service Rate
CF_{SP}	=	Peak Coincidence Factor (summer peak)
CF_{WP}	=	Peak Coincidence Factor (winter peak)
RR_E	=	Realization Rate for energy (kWh, MMBtu)
RR_{SP}	=	Realization Rate for summer peak kW
RR_{WP}	=	Realization Rate for winter peak kW

NTG	=	Net-to-Gross Ratio
FR	=	Free-Ridership Factor
SO_P	=	Participant Spillover Factor
SO_{NP}	=	Non-Participant Spillover Factor

Calculations of Coincident Peak Demand kW Using "Seasonal Peak" Coincidence Factors

The formulas above for peak demand kW savings use the "on-peak" coincidence factors (CF_{SP}, CF_{WP}), which apply the "on-peak" coincidence methodology as allowed for submission to the FCM. The alternative methodology is the "seasonal peak" methodology, which uses the identical formulas, but substituting the "seasonal peak" coincidence factors for the "on-peak" coincidence factors:

CF_{SSP}	=	Peak Coincidence Factor for Summer Seasonal Peak
CF_{WSP}	=	Peak Coincidence Factor for Winter Seasonal Peak

Residential Efficiency Measures

Appliances – Clothes Dryer

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Clothes Dryers exceeding minimum qualifying efficiency standards established as ENERGY STAR with drum moisture sensors and associated moisture sensing controls achieve greater energy savings over clothes dryers that do not have moisture sensors.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Clothes Dryers
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

Annual kWh Savings = Annual kWh usage baseline – Annual kWh usage Energy Star
*Annual kWh usage baseline= (lbs/load) / Baseline CEF * loads/yr*
*Annual kWh usage ENERGY STAR= (lbs/load) / ENERGY STAR CEF * loads/yr*

Where:
Baseline Combined Energy Factor (CEF) (lbs/kWh) = 3.11[2]
ENERGY STAR CEF = 3.93[3]
Lbs/load = 8.45[4]
Loads/Year = 283[5]

Energy Star Dryer Savings

Measure Name	Core Initiative	ΔkWh	ΔkW[6]
Dryer (Energy Star)	Res Products	160	0.02

[2] DOE (2015). 10 CFR Part 431 March 27, 2015. *Energy Conservation Program: Energy Conservation Standards for Residential Clothes Dryers*. Table II.7. http://www.gpo.gov/fdsys/pkg/FR-2015-03-27/pdf/2015-07058.pdf
[3] Ibid.
[4] DOE (2013). 10 CFR Parts 429 and 430 August 14, 2013. *Energy Conservation Program: Test Procedures for Residential Clothes Dryers; Final Rule.* Table 11.1. http://www.gpo.gov/fdsys/pkg/FR-2013-08-14/pdf/2013-18931.pdf
[5] Ibid.
[6] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Baseline Efficiency

The baseline efficiency case is a new electric resistance dryer that meets the federal standard as of January 1, 2015 which is an Energy Factor (EF) of 3.73 for a vented standard dryer. Different testing procedures were used in setting the federal standard (DOE Test Procedure Appendix D1) and the Energy Star standard (DOE Test Procedure Appendix D2). To enable comparison a baseline CEF of 3.11 is used. This was derived from ENERGY STAR Version 1.0 Estimated Baseline which multiplies the 2015 federal standard by the average change in electric dryers' assessed CEF between Appendix D1 and Appendix D2: 3.73-(3.73*0.166).

High Efficiency

The high efficiency case is a new electric resistance dryer that meets the Energy Star standard as of January 1, 2015. The ENERGY STAR CEF (Combined Energy Factor) is 3.93. .

Measure Life

The measure life is 12 years.[7]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Dryer (Energy Star)	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.90

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[8]

[7] MA Common Assumptions

Appliances – Early Retirement Clothes Washers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The replacement and recycling of a working top-loading clothes washer with an agitator with an Energy Star rated front-loading washing machine.
Primary Energy Impact: Electric
Secondary Energy Impact: Oil, Propane, Gas
Non-Energy Impact:
Sector: Residential
Market: Retrofit
End Use: Process, Hot Water
Measure Type: Clothes Washers
Core Initiative: Electric – Residential Home Energy Services, Gas – Residential Home Energy Services

Notes

Collectively the MA PAs decided that the gas PAs will claim all the gas savings while the electric PAs claim all the other savings.

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

*ΔkWh = [(Capacity * 1/IMEFbase * Ncycles) * (%CWkwhbase + %DHWkwhbase + %Dryerkwhbase)] - [(Capacity * 1/IMEFeff * Ncycles) * (%CWkwheff + %DHWkwheff + %Dryerkwheff)]*

*ΔMMBTUs = [(Capacity * 1/MEFbase * Ncycles) * ((%DHWffbase *r_eff) + %Dryerffbase] - [(Capacity * 1/MEFeff * Ncycles) * (%DHWffeff * r_eff) + %Dryergaseff]*MMBTU_convert*

Where:

Capacity	=	washer volume in ft^3. Existing top loading washer is 3.09 ft^3, new standard efficiency top loading washer is 3.38 ft^3, ENERGY STAR front loading is 3.90 ft^3
IMEF	=	Integrated Modified Energy Factor and is measured in ft^3/kWh/cycle
Ncycles	=	283 loads per year[9]
%CWkwh	=	% of total kWh energy consumption for clothes washer operation (different for baseline and efficient unit). See table below
%DHWkwh	=	% of total kWh energy consumption used for water heating (different for baseline and efficient unit). See table below. If water is heated by gas or propane this is 0%

[9] Department of Energy 10 CFR Parts 429 and 430 August 14, 2013. *Energy Conservation Program: Test Procedures for Residential Clothes Dryers; Final Rule.* Table 11.1. http://www.gpo.gov/fdsys/pkg/FR-2013-08-14/pdf/2013-18931.pdf

%Dryerkwh = % of total kWh energy consumption for dryer operation (different for baseline and efficient unit). See table below. If the dryer is gas this is 0%

%DHWff = % of total fossil fuel energy consumption used for water heating (different for baseline and efficient unit). See table below. If water is heated by electric this is 0%.

%Dryerff = % of total fossil fuel energy consumption for dryer operation (different for baseline and efficient unit). See table below. If the dryer is electric this is 0%.

r_eff = recovery energy factor used to account for the difference in recovery efficiencies of electric and gas/oil/propane hot water heaters. Electric water heaters are 100% efficient while other water heaters are 75% efficient. The ratio is 1.33 (100%/75%)

MMBTU_convert = Conversion factor from kWh to MMBTU is 0.003412

Efficiency Ratings and Percentage of Total Energy Consumption[10]

	% Energy used for			IMEF	IWF	Volume
	Washer operation	Water heating	Drying	ft^3/kWh/ cycle	gallons/ cycle/ft^3	ft^3
Existing-Top Loading CW	8%	34%	59%	0.84	9.92	3.09
New-Federal Standard Top Loading CW	5%	37%	58%	1.29	8.44	3.38
New-Energy Star Front Loading CW	8%	20%	72%	2.38	3.70	3.90

Savings from Early Retirement of Clothes Washers

Measure Name	Energy Type	ΔkWh	ΔkW	Δ MMBtu
Early Retirement CW (Retire) Elec DHW & Elec Dryer	Electric	302	0.05	0
Early Retirement CW (EE) Elec DHW & Elec Dryer	Electric	275	0.04	0
Early Retirement CW (Retire) Gas DHW & Elec Dryer	Electric/Gas	224	0.03	0.35
Early Retirement CW (EE) Gas DHW & Elec Dryer	Electric/Gas	94	0.01	0.82
Early Retirement CW (Retire) Elec DHW & Gas Dryer	Electric/Gas	118	0.02	0.63
Early Retirement CW (EE) Elec DHW & Gas Dryer	Electric/Gas	180	0.03	0.32
Early Retirement CW (Retire) Gas DHW & Gas Dryer	Electric/Gas	41	0.01	0.98
Early Retirement CW (EE) Gas DHW & Gas Dryer	Electric/Gas	-0.1	0.00	1.14
Early Retirement CW (Retire) Oil DHW & Elec Dryer	Electric/Oil	224	0.03	0.35
Early Retirement CW (EE) Oil DHW & Elec Dryer	Electric/Oil	94	0.01	0.82
Early Retirement CW (Retire) Propane DHW & Elec Dryer	Electric/Propane	224	0.03	0.35
Early Retirement CW (EE) Propane DHW & Elec Dryer	Electric/Propane	94	0.01	0.82

Baseline Efficiency

It is assumed that the existing top loading clothes washer met the 2007 federal standard which was an MEF[11] > 1.262 and WF[12] < 9.53. This is equivalent to an IMEF of 0.84 and IWH[13] of 9.92. A new standard efficiency clothes washer meets the federal standard for top loading washers effective 3/7/2015 which requires an IMEF> 1.29 and an IWF < 8.4.

[10] DOE (2012). Technical Support Document: Energy Efficiency Program for Consumer Products and Commercial and Industrial Equipment: Residential Clothes Washers. http://www.regulations.gov/#!documentDetail;D=EERE-2008-BT-STD-0019-0047 Chapter 7. Energy and Water Use Determination (corrected)

[11] MEF is Modified Energy Factor and is measured in ft^3/kWh/cycle

[12] WF is Water Factor and is measured in gallons/cycle/ft^3

[13] IWF is Integrated Water Factor and is measured in gallons/cycle/ft^3

High Efficiency

The new high efficiency washer is a front loading Energy Star rated washer with a minimum IMEF > 2.38 and IWF < 3.7.

Measure Life

The effective useful life of the new clothes washer is assumed to be 12 years. The remaining useful life of the existing clothes washer is assumed to be 1/3 of the effective useful life which is 4 years.

Secondary Energy Impacts

Secondary energy impacts are described in the same section as primary energy impacts.

Non-Energy Impacts

ΔWater (gallons) = (Capacity * (IWFbase - IWFeff)) * Ncycles

Where:
Capacity = washer volume in ft^3
IWF = IWF is Integrated Water Factor and is measured in gallons/cycle/ft^3
Ncycles = 283 loads per year[14]

Benefit Type	Description	Savings
Residential Water	Early Retirement CW (Retire) Water Savings	603 Gallons/Unit
Residential Water	Early Retirement CW (EE) Water Savings	3,984 Gallons/Unit

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[15]

[15] The Cadmus Group, Inc. (2012). *Demand Impact Model*. Prepared for the Massachusetts Program Administrators.

Appliances – Refrigerator (Lost Opportunity)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Rebates for purchase of ENERGY STAR® Most Efficient qualified refrigerators. The ENERGY STAR Most Efficient designation recognizes the most efficient products among those that qualify for the ENERGY STAR program.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Refrigerators
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are based on the following algorithm which uses averaged inputs based on data published by the EPA[16]:

$$\Delta kWh = \Delta kWh_{BASE} - \Delta kWh_{ES}$$

Where:
Unit = Installed ENERGY STAR® Most Efficient refrigerator
ΔkWh_{BASE} = Average usage of a new refrigerator meeting federal standards, by model type
ΔkWh_{ES} = Average usage of a new refrigerator meeting ENERGY STAR® Most Efficient standards , by model type

Savings for Refrigerators

Tier	ΔkWh[17]	ΔkW[18]
Refrigerator (Most Efficient)	118	0.01

Baseline Efficiency

The baseline efficiency case is a residential refrigerator that meets the federal minimum standard for energy efficiency.

[16] https://data.energystar.gov/Active-Specifications/ENERGY-STAR-Most-Efficient-Residential-Refrigerato/hgxv-ux9b
[17] Apex Analytics (2015). 2015 Refrigerator Savings Modeling.xls.
[18] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

High Efficiency

The high efficiency case is an ENERGY STAR® Most Efficient residential refrigerator.

Hours

Not applicable.

Measure Life

The measure life is 12 years.[19]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Refrigerator Rebate	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.93

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[20]

Appliances – Refrigerator (Retrofit)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure covers the replacement of an existing inefficient refrigerator with a new ENERGY STAR® rated refrigerator. ENERGY STAR certified refrigerators are 9 percent more energy efficient than models that meet the federal minimum standard for energy efficiency.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Retrofit
End Use: Process
Measure Type: Refrigerators
Core Initiative: Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and averaged inputs:

$$\Delta kWh = \Delta kWh_{RETIRE} + \Delta kWh_{EE}$$
$$\Delta kW = \Delta kW_{RETIRE} + \Delta kW_{EE}$$

Where:

Unit	=	Replacement of existing refrigerator with new ENERGY STAR® Refrigerator
ΔkWh_{RETIRE}	=	Annual energy savings over remaining life of existing equipment: 661 kWh[21]
ΔkWh_{EE}	=	Annual energy savings over full life of new ES refrigerator: 53 kWh[22]
ΔkW_{RETIRE}	=	Average demand reduction over remaining life of existing equipment: 0.082 kW[23]
ΔkW_{EE}	=	Average demand reduction over full life of new ES refrigerator: 0.007 kW[24]

[21] The Cadmus Group, Inc. (2012). *Home Energy Services Impact Evaluation.*. Prepared for the Electric and Gas Program Administrators of Massachusetts. 714 kWh minus 53 kWh = 661 kWh
[22] Apex Analytics (2015). 2015 Refrigerator Savings Modeling.xls. Using data published by the EPA. https://www.energystar.gov/productfinder/product/certified-residential-refrigerators/results
[23] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.
[24] Ibid.

Savings for Refrigerators

Tier	ΔkWh	ΔkW[25]
Refrigerator (Savings Over Remaining Life)	661	0.08
Refrigerator (Savings Compared to Baseline)	53	0.01

Baseline Efficiency

The baseline efficiency case is an existing refrigerator for savings over the remaining life of existing equipment. The baseline efficiency case is a full-sized refrigerator that meets the federal minimum standard for energy efficiency for savings for the full life.[26]

High Efficiency

The high efficiency case is an ENERGY STAR® rated refrigerator that meets the ENERGY STAR® criteria for full-sized refrigerators, using at least 9% less energy than models meeting the minimum federal government standard.

Hours

Savings are based on 8,760 operating hours per year.

Measure Life

The effective useful life of the new refrigerator is 12 years. [27] The remaining useful life of the existing refrigerator is estimated to be 4 years[28].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Appliances – Refrigerator Replacement

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure covers the replacement of an existing inefficient refrigerator with a new refrigerator.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Process
Measure Type: Refrigerators
Core Initiative: Electric - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[30].

Savings for Refrigerator Replacement

Measure	Core Initiative	ΔkWh	ΔkW[31]
Refrigerator Replacement	LI 1-4 Retrofit	762	0.09

Baseline Efficiency

The baseline efficiency case for both the replaced and baseline new refrigerator is an existing refrigerator. It is assumed that low-income customers would otherwise replace their refrigerators with a used inefficient unit.

High Efficiency

The high efficiency case is a new refrigerator.

Hours

Savings are based on 8,760 operating hours per year.

Measure Life

The measure life is 12 years.[32]

[30] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[31] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Refrigerator Replacement	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	1.00	0.93

In-Service Rates
In-service rates are 100% as it is assumed all refrigerators are in-use.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[33]

[32] *Savings Calculator for Energy Star Qualified Appliances.* http://www.energystar.gov/sites/default/files/asset/document/appliance_calculator.xlsx

Appliances – Refrigerator Replacement

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Removal of old inefficient refrigerator or freezer with the installation of new efficient refrigerator or freezer.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Process
Measure Type: Refrigerators
Core Initiative: Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = \left[\left(\left(kWh_{pre} - kWh_{ES}\right) \times \frac{RUL}{EUL}\right) + \left(\left(\frac{kWh_{std} + kWh_{used}}{2} - kWh_{ES}\right) \times \frac{EUL - RUL}{EUL}\right)\right] \times F_{occ}$$

$$\Delta kW = \Delta kWh \times kW / kWh$$

Where:

kWh_{pre}	=	Annual kWh consumption of existing equipment. Value is based on metering or AHAM database. The default value is 874 kWh.
kWh_{ES}	=	Annual kWh consumption of new ENERGY STAR qualified refrigerator or freezer. This is from the nameplate on the new unit. The default value is 358 kWh.
STD		Average annual consumption of equipment meeting federal standard: Calculated by dividing the kWh_{ES} by 0.9 (i.e., the Energy Star units are assumed to be 10% more efficient than the kWh_{std} units). The default value is 398 kWh.
kWh_{used}		Average annual consumption of used equipment. Default value is 475 kWh.[34]
RUL	=	Remaining Useful life assumed to be 6 years
EUL	=	Estimated useful life for a new refrigerator is 12 years[35]
Focc	=	Occupant adjustment factor used to adjust the energy savings according to the number of occupants in the dwelling unit. See table below. Default is 2.3 occupants per tenant unit
ΔkWh	=	330, using the default assumptions

[34] Association of Home Appliance Manufacturers (2014 Revised Feb. 2015), *Technical Support Document: Early Replacement Program*, (Value estimated based on Figure 9 on page 23)
[35] Environmental Protection Agency (2014). *Savings Calculator for Energy Star Qualified Appliances*.

kW/kWh = Average kW reduction per kWh reduction: 0.00013 kW/kWh[36]
ΔkW = 0.042, using the default assumptions

Occupant Adjustment Factor[37]

Number of Occupants	F_{occ}
0 occupants	1.00
1 occupants	1.05
1.8 occupants	1.09
2 occupants	1.10
2.3 occupants	1.11
3 occupants	1.13
4 occupants	1.15
5 occupants	1.16

Baseline Efficiency

The baseline efficiency case is an existing refrigerator for which the annual kWh may be looked up in a refrigerator database. If the manufacturer and model number are not found, the refrigerator is metered for 1.5 hours in order to determine the annual kWh.

High Efficiency

The high efficiency case is a new more efficiency refrigerator. The manufacturer and model number is looked up in a refrigerator database to determine annual kWh.

Measure Life

The measure life is 12 years[38].

Hours

Not applicable.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[36] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators. Loadshape: Res Multi Family Electric Refrigeration (REFRIGERATOR) Normal
[37] The Cadmus Group (2012). *Massachusetts 2011 Residential Retrofit Multifamily Program Impact Analysis*. Prepared for the Massachusetts Electric and Gas Program Administrators.

In-Service Rates
All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since this measure has not been evaluated.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[39]

[39] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Appliances – Refrigerator Replacement

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Removal of old inefficient refrigerator or freezer with the installation of new efficient refrigerator or freezer.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Process
Measure Type: Refrigerators
Core Initiative: Electric - Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = \left[\left((kWh_{pre} - kWh_{ES})\right) \times \frac{(12-8)}{12} + \left((kWh_{std} - kWh_{ES})\right) \times \frac{8}{12}\right] \times F_{occ}$$

$$\Delta kW = \Delta kWh \times kW / kWh$$

Where:

kWh_{pre}	=	Annual kWh consumption of existing equipment. Value is based on metering or AHAM database
kWh_{std}	=	Annual kWh consumption of a refrigerator meeting federal standards. Calculated by dividing the kWh_{ES} by 0.9 (i.e., the Energy Star units are assumed to be 10% more efficient than the kWh_{std} units).
kWh_{ES}	=	Annual kWh consumption of new Energy Star qualified refrigerator or freezer. This is from the nameplate on the new unit.
Age	=	Age of the existing refrigerator is 8 years
12	=	Measure life for a new refrigerator[40]
Focc	=	Occupant adjustment factor used to adjust the energy savings according to the number of occupants in the dwelling unit. See below.
kW/kWh	=	Average kW reduction per kWh reduction: 0.00013 kW/kWh[41]

[40] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Residential Refrigerator*.
[41] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators. Loadshape: Res Multi Family Electric Refrigeration (REFRIGERATOR) Normal

Occupant Adjustment Factor[42]

Number of Occupants	F_{occ}
0 occupants	1.00
1 occupants	1.05
1.8 occupants	1.09
2 occupants	1.10
3 occupants	1.13
4 occupants	1.15
5 occupants	1.16

Baseline Efficiency

The baseline efficiency case is an existing refrigerator for which the annual kWh may be looked up in a refrigerator database. If the manufacturer and model number are not found, the refrigerator is metered for 1.5 hours in order to determine the annual kWh.

High Efficiency

The high efficiency case is a new more efficiency refrigerator. The manufacture and model number is looked up in a refrigerator database to determine annual kWh.

Measure Life

The measure life is 12 years[43].

Hours

Not applicable.

Appliances – Freezers (Lost Opportunity)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Rebates provided for the purchase of ENERGY STAR® freezers. ENERGY STAR® qualified freezers use at least 10% less energy than new, non-qualified models and return even greater savings compared to old models.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Freezers
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are based on the following algorithms which use averaged inputs based on data published by the EPA[45]:

$$\Delta kWh = \Delta kWh_{BASE} - \Delta kWh_{ES}$$

Where:
Unit = Installed ENERGY STAR® freezer
kWh_{BASE} = Average usage of a new freezer meeting federal standards
kWh_{ES} = Average usage of a new freezer meeting ENERGY STAR® standards

Savings for Freezers

Measure Name	ΔkWh[46]	ΔkW[47]
Freezer (Energy Star)	43.7	0.01

Baseline Efficiency

The baseline efficiency case is a residential freezer that meets the Federal minimum standard for energy efficiency.

[45] http://www.energystar.gov/productfinder/product/certified-residential-freezers/results
[46] Ibid.
[47] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

High Efficiency

The high efficiency case is based on an ENERGY STAR® rated freezer that uses 10% less energy than models not labeled with the ENERGY STAR® logo.

Hours

Not applicable.

Measure Life

The measure life is 12 years.[48]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Freezer (Energy Star)	Res Products	All	1.00	1.00	1.00	1.00	1.00	0. 93

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described in the Cadmus Demand Impact Model.[49]

Appliances – Refrigerator/Freezer Recycling

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The retirement of old, inefficient secondary refrigerators and freezers. Refrigerator Recycling (Primary) - Participants who retired and replaced a primary refrigerator; Refrigerator Recycling (Secondary Replaced)- Participants who retired and replaced a secondary refrigerator; Refrigerator Recycling (Secondary Not Replaced)- Participants who retired, but did not replace, a secondary refrigerator; Refrigerator Recycling (Combined) – combination of secondary replaced and secondary not replaced

Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Process
Measure Type: Recycling
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed and are obtained from the referenced study[54].

Savings for Refrigerator/Freezer Recycling

Measure Name	Core Initiative	ΔkWh	ΔkW[55]
Refrigerator Recycling (Primary)	Res Products	533	0.07
Refrigerator Recycling (Secondary Replaced)	Res Products	696	0.09
Refrigerator Recycling (Secondary Not Replaced)	Res Products	835	0.10
Refrigerator Recycling (Combined)	Res Products	755	0.09
Freezer Recycling	Res Products	663	0.08

Baseline Efficiency

The baseline efficiency case is an old, inefficient secondary working refrigerator or freezer. Estimated average usage is based on combined weight of freezer energy use and refrigerator energy use.

High Efficiency

The high efficiency case assumes no replacement of secondary unit.

[54] NMR Group, Inc. (2011). Massachusetts Appliance Turn-In Program Evaluation Integrated Report Findings – FINAL. Prepared for National Grid, Eversource (NSTAR) Electric, Cape Light Compact, and Western Massachusetts Electric Company.
[55] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Hours

Refrigerator and freezer operating hours are 8,760 hours/year.

Measure Life

The measure life is 8 years.[56]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Refrigerator Recycling (Primary)	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.93
Refrigerator Recycling (Secondary Replaced)	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.93
Refrigerator Recycling (Secondary Not Replaced)	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.93

Appliances – Appliance Removal

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Removal of second working refrigerator or freezer.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Process
Measure Type: Recycling
Core Initiative: Electric - Low-Income Single Family Retrofit, Low-Income Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[58].

Measure Name	ΔkWh	ΔkW[59]
Appliance Removal	874	0.11

Baseline Efficiency

The baseline efficiency case is the old, inefficient secondary working refrigerator or freezer.

High Efficiency

The high efficiency case assumes no replacement of secondary unit.

Hours

Not applicable.

Measure Life

The measure life is 5 years.[60]

Building Shell – Weatherization

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of weatherization measures such as air sealing and insulation
Primary Energy Impact: Electric, Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Envelope
Measure Type: Insulation & Air Sealing
Core Initiative: Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are per home and deemed based on study results[62].

Measure Name	Core Initiative	PA Type	Energy Type	ΔkWh	ΔkW[63]	ΔMMBtu
Weatherization, Electric	LI 1-4 Retrofit	Elec	Electric	1,616	0.86	
Weatherization, Oil	LI 1-4 Retrofit	Elec	Oil			28.1
Weatherization, Other	LI 1-4 Retrofit	Elec	Propane			26.3
Weatherization	LI 1-4 Retrofit	Gas	Gas			26.3
Air Sealing, Electric	LI 1-4 Retrofit	Elec	Electric	501	0.27	
Air Sealing, Oil	LI 1-4 Retrofit	Elec	Oil			9.9
Air Sealing, Other	LI 1-4 Retrofit	Elec	Propane			10.5
Air Sealing	LI 1-4 Retrofit	Gas	Gas			10.5
Insulation, Electric	LI 1-4 Retrofit	Elec	Electric	1,115	0.60	
Insulation, Oil	LI 1-4 Retrofit	Elec	Oil			18.2
Insulation, Other	LI 1-4 Retrofit	Elec	Propane			15.8
Insulation	LI 1-4 Retrofit	Gas	Gas			15.8

Baseline Efficiency

The baseline efficiency case is any existing home shell measures.

[62] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[63] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

High Efficiency

The high efficiency case includes the installation of weatherization measures (air sealing & insulation).

Hours

Not applicable.

Measure Life

For the combined weatherization measure the measure life is 20 years.[64] For insulation the measure life is 25 years and for air sealing the measure life is 15 years.

Secondary Energy Impacts

Electric savings are achieved from reduced fan run time for heating and from reduced cooling.

Measure	Core Initiative	PA Type	ΔkWh[65]	ΔkW[66]
Weatherization, Oil	LI 1-4 Retrofit	Elec	377	0.30
Weatherization, Other	LI 1-4 Retrofit	Elec	344	0.31
Weatherization	LI 1-4 Retrofit	Gas	344	0.31

Building Shell – Air Sealing

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Air sealing installed through the Home Energy Services (MassSAVE) program. Air sealing will decrease the infiltration of outside air through cracks and leaks in the home
Primary Energy Impact: Electric, Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Envelope
Measure Type: Air Sealing
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

The Program Administrators currently use vendor calculated energy savings for these measures in the Residential Home Energy Services electric program. These savings values are calculated using vendor proprietary software where the user inputs a minimum set of technical data about the house and the software calculates building heating and cooling loads and other key parameters. The proprietary building model is based on thermal transfer, building gains, and a variable-based heating/cooling degree day/hour climate model. This provides an initial estimate of energy use that may be compared with actual billing data to adjust as needed for existing conditions. Then, specific recommendations for improvements are added and savings are calculated using measure-specific heat transfer algorithms.

Rather than using a fixed degree day approach, the building model estimates both heating degree days and cooling degree hours based on the actual characteristics and location of the house to determine the heating and cooling balance point temperatures. Savings from shell measures use standard U-value, area, and degree day algorithms. Infiltration savings use site-specific seasonal N-factors to convert measured leakage to seasonal energy impacts. HVAC savings are estimated based on changes in system and/or distribution efficiency improvements, using ASHRAE 152 as their basis. Lighting, appliance, and water heating savings are based on standard algorithms, taking into account operating conditions and pre- and post-retrofit energy consumption. Interactivity between architectural and mechanical measures is always included, to avoid overestimating savings due to incorrectly “adding” individual measure results.

The PAs calculate demand (kW) savings by applying a kW/kWh factor to the vendor-estimated electric energy savings. The kW/kWh factors are provided in the table below.

kW Factors for HES Vendor Measures

Measure	kW/kWh Factor[68]
Air Sealing (Electric)	0.00053
Air Sealing (Gas, Oil, Propane)	0.00222

Baseline Efficiency

The baseline efficiency case is the existing conditions of the participating household.

High Efficiency

The high efficiency case is a home that has air sealing performed.

Hours

Hours are project-specific.

Measure Life

The measure life is 15 years.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[68] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators. For electric measures the heating loadshape was used for non-electric the central AC loadshape was used.

Impact Factors for Calculating Adjusted Gross Savings

Building Shell – Air Sealing

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Air sealing will decrease the infiltration of outside air through cracks and leaks in the building.
Primary Energy Impact: Electric, Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: Envelope
Measure Type: Air Sealing
Core Initiative: Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit, Gas - Multi-Family Retrofit, Gas - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = \frac{Vol \times \Delta ACH \times 0.018 \times HDD \times \frac{24}{\eta_{heating}}}{3413}$$

$$\Delta MMBtu = \frac{Vol \times \Delta ACH \times 0.018 \times HDD \times \frac{24}{\eta_{heating}}}{1{,}000{,}000}$$

$$\Delta kW = \Delta kWh \times kW / kWh$$

Where:

Vol	=	[ft3] This is the air volume of the treated space, calculated from the dimensions of the space, which could include the number of floors, the floor area per floor, and the floor-to-ceiling height, or the dwelling floor area and number of dwellings. The treated space can be the entire building including the common areas, or just the individual dwelling units. (Auditor Input)
ΔACH	=	[ºF-day] Infiltration reduction in Air Changes per Hour, natural infiltration basis. This will typically be a default value, but the source of the assumption should be transparent and traceable, or it could come from a blower door test. (Stipulated Value or Blower Door Test)
HDD60	=	Heating degree-days, base 60 from TMY3 weather data. See table below.
ηheating	=	[AFUE, COP, thermal efficiency(%)] Efficiency of the heating system, as determined on site (Auditor Input)
24	=	Conversion factor: 24 hours per day
0.018	=	[Btu/ft3- ºF] Air heat capacity: The specific heat of air (0.24 Btu/ºF.lb) times the density

of air (0.075 lb/ft3)
1,000,000 = Conversion factor: 1,000,000 Btu per MMBtu
3413 = Conversion factor: 3413 Btu/kWh
kW/kWh = Average kW reduction per kWh reduction: 0.00050 kW/kWh[71]

Baseline Efficiency

The baseline efficiency case is the existing building before the air sealing measure is implemented. The baseline building is characterized by the existing air changes per hour (ACHPRE) for multi-family facilities, which is measured prior to the implementation of the air sealing measure. This will typically be a default value of a baseline/pre-retrofit ACH =0.5

High Efficiency

The baseline efficiency case is the existing building after the air sealing measure is implemented. The high efficiency building is characterized by the new air changes per hour (ACH_{POST}) for multi-family facilities, which is measured after the air sealing measure is implemented. This will typically be a default value of a baseline/pre-retrofit ACH =0.4.

Hours

Heating hours are characterized by the heating degree days for the facility. The heating degree days are looked up based on the nearest weather station to the customer, as selected by the program vendor.

Building Shell – Insulation

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Shell insulation installed through the Home Energy Services (MassSAVE) program.
Primary Energy Impact: Electric, Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Envelope
Measure Type: Air Sealing
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

The Program Administrators currently use vendor calculated energy savings for these measures in the Residential Home Energy Services electric program. These savings values are calculated using vendor proprietary software where the user inputs a minimum set of technical data about the house and the software calculates building heating and cooling loads and other key parameters. The proprietary building model is based on thermal transfer, building gains, and a variable-based heating/cooling degree day/hour climate model. This provides an initial estimate of energy use that may be compared with actual billing data to adjust as needed for existing conditions. Then, specific recommendations for improvements are added and savings are calculated using measure-specific heat transfer algorithms.

Rather than using a fixed degree day approach, the building model estimates both heating degree days and cooling degree hours based on the actual characteristics and location of the house to determine the heating and cooling balance point temperatures. Savings from shell measures use standard U-value, area, and degree day algorithms. Infiltration savings use site-specific seasonal N-factors to convert measured leakage to seasonal energy impacts. HVAC savings are estimated based on changes in system and/or distribution efficiency improvements, using ASHRAE 152 as their basis. Lighting, appliance, and water heating savings are based on standard algorithms, taking into account operating conditions and pre- and post-retrofit energy consumption. Interactivity between architectural and mechanical measures is always included, to avoid overestimating savings due to incorrectly “adding” individual measure results.

The PAs calculate demand (kW) savings by applying a kW/kWh factor to the vendor-estimated electric energy savings. The kW/kWh factors are provided in the table below.

kW Factors for HES Vendor Measures

Measure	kW/kWh Factor[76]
Insulation (Electric)	0.00053
Insulation (Gas, Oil, Other FF)	0.00071

Baseline Efficiency

The baseline efficiency case is the existing conditions of the participating household.

High Efficiency

The high efficiency case is a home with added insulation.

Hours

Hours are project-specific.

Measure Life

The measure life is 25 years.

Secondary Energy Impacts

Electric savings are from reduced furnace fan runtime and reduced cooling due to installed insulation. The kWh savings values are deemed based on study results[77].

Measure Name	ΔkWh	ΔkW[78]
Insulation, Gas	209	0.15
Insulation, Oil	224	0.16
Insulation, Other	209	0.15

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on evaluation results[79].

Coincidence Factor
Summer and winter coincidence factors are estimated using demand allocation methodology described the Cadmus Demand Impact Model.[80]

[79] The Cadmus Group (2013). *HES Realization Rate Results Memo*. June 2013
[80] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Building Shell – Insulation

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Insulation upgrades are applied in existing multifamily facilities.
Primary Energy Impact: Electric, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: Envelope
Measure Type: Insulation
Core Initiative: Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit, Gas - Multi-Family Retrofit, Gas - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

$$MMBTu_{annual} = \frac{\left(\frac{1}{R_{exist}} - \frac{1}{R_{new}}\right) \times HDD \times 24 \times Area}{1{,}000{,}000 \times \eta_{heat}}$$

$kWh_{annual} = MMBTu_{annual}\ x\ 293.1$

$kW = kWh_{annual}\ x\ kW/kWh_{heating}$

Where:

R_{exist}	=	Existing effective R-value (R-ExistingInsulation + R-Assembly), ft^2-°F/Btuh
R_{new}	=	New total effective R-value (R-ProposedMeasure + R-ExistingInsulation + R-Assembly), ft^2-°F/Btuh
Area	=	Square footage of insulated area
η_{heat}	=	Efficiency of the heating system (AFUE or COP)
293.1	=	Conversion constant (1MMBtu = 293.1 kWh)
24	=	Conversion for hours per day
HDD	=	Heating Degree Days; dependent on location, see table below
1,000,000	=	Conversion from Btu to MMBtu
kW/kWh heating	=	Average annual kW reduction per kWh reduction: 0.00050 kW/kWh[81]

[81] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Baseline Efficiency

The baseline efficiency case is characterized by the total R-value of the existing attic, basement or sidewall (R_{exisit}). This is calculated as the R-value of the existing insulation, estimated by the program contractor, plus the R-value of the ceiling, floor, or wall (for all projects: $R_{CEILING}$ = 3.36; R_{FLOOR} = 6.16; R_{WALL} = 6.65)[82].

High Efficiency

The high efficiency case is characterized by the total R-value of the attic after the installation of additional attic, basement or sidewall insulation. This is calculated as the sum of the existing R-value (R_{exisit}) plus the R-value of the added insulation.

Hours

Heating hours are characterized by the heating degree days for the facility. The heating degree days are looked up based on the nearest weather station to the customer, as selected by the program vendor.

HDD_{60} Values by Weather Station[83]

TMY3 City	HDD	CDH
Barnstable Muni Boa	4379	1349
Beverly Muni	5329	3432

HVAC – Central Air Conditioning

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of high efficiency Central AC systems.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Cooling
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}} \right) \times Hours$$

$$\Delta kW = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}} \right)$$

Where:
Tons = Cooling capacity of AC equipment
$SEER_{BASE}$ = Seasonal Energy Efficiency Ratio of baseline AC equipment
$SEER_{EE}$ = Seasonal Energy Efficiency Ratio of new efficient AC equipment.
EER_{BASE} = Energy Efficiency Ratio of base AC equipment
EER_{EE} = Energy Efficiency Ratio of new efficient AC equipment.
Hours = Equivalent full load hours

Savings for Residential Central Air Conditioners[89]

Measure Name	Average Size (tons)	SEER	EER	ΔkW	ΔkWh
Central Air SEER 16.0 EER 13	2.6	16	13	0.55	198.8

Baseline Efficiency

The baseline efficiency case is a 2.6 ton central air-conditioning system with SEER = 13 and EER = 11 for replace on failure and SEER = 10 and EER = 8.5 for early retirement.

---

[89] Savings have been adjusted to reflect the mix of replace on failure and early replacement. Percentage of early retirement is from The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. Prepared for the Electric and Gas Program Administrators of Massachusetts. The calculation of the adjustment can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook

High Efficiency

The high efficiency case is an ENERGY STAR® qualified Central AC system.

Hours

The equivalent full load cooling hours are 360 hours per year.[90]

Measure Life

The measure life is 16 years. [91]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Central Air SEER 16.0 EER 13	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on evaluation study results.[92]

[90] ADM Associates, Inc. (2009). *Residential Central AC Regional Evaluation*. Prepared for NSTAR, National Grid, Connecticut Light & Power and United Illuminating; Page 4-5, Table 4-3.

HVAC – Down Size ½ Ton

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Reduction in system size consistent with manual J calculations.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Cooling
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on results of DOE2 modeling:

Units	=	Completed job
ΔkW/Ton	=	Average demand reduction per ton: 0.30 kW[93]
ΔkWh/Ton	=	Average annual energy reduction per ton: 203 kWh[94]

Baseline Efficiency

The baseline efficiency case is a system that is not sized in accordance with manual J calculation.

High Efficiency

The high efficiency case is a system that is sized in accordance with manual J calculation.

Hours

Not applicable.

Measure Life

The measure life is 18 years.[95]

---

[93] RLW Analytics (2002). *Market Research for the Rhode Island, Massachusetts, and Connecticut Residential HVAC Market*. Prepared for National Grid, Northeast Utilities, NSTAR, Fitchburg Gas and Electric Light Company and United Illuminating; Page 3, Table 2

HVAC – Early Retirement of Central Air Conditioning

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early replacement of Central Air Conditioning
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Cooling
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left[\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}} \right) \times Hours_C + \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}} \right) \times Hours_H \right]$$

$$\Delta kW = \max(\Delta kW_{COOL}, \Delta kW_{HEAT})$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}} \right)$$

Where:

Unit	=	Replacement of existing inefficient system with new efficient system
Tons	=	Capacity of AC equipment: Current default is 2.6 tons
$SEER_{BASE}$	=	Seasonal efficiency of baseline AC equipment
$SEER_{EE}$	=	Seasonal efficiency of new efficient AC equipment
EER_{BASE}	=	Peak efficiency of base AC equipment
EER_{EE}	=	Peak efficiency of new efficient AC equipment
$Hours_C$	=	EFLH for cooling

Savings for Early Retirement Air Conditioners[97]

Measure Name	EER_{BASE}	$SEER_{BASE}$	EER_{EE}	$SEER_{EE}$	ΔkW_C	ΔkW_H	ΔkWh
Early Retirement Central Air (Retire)	8.5	10	11	13	0.83	0.00	259
Early Retirement Central Air (EE) SEER 16	11	13	13	16	0.44	0.00	162

Baseline Efficiency

The baseline efficiency case is assumed to be a typical 10-12 year-old central air-conditioning unit with SEER 10, EER 8.5

High Efficiency

For the retirement savings over the remaining life of existing AC unit, the efficient case is a SEER 13, EER 11 unit. For the high efficiency savings over lifetime of the new unit, the efficient case is a new high efficiency SEER 16, EER 13 unit.

Hours

The equivalent full load hours are 360 hours per year for cooling.[98]

Measure Life

The remaining life for the existing unit is 6 years[99], and the measure life of new equipment is 18 years[100]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Early Retirement Central Air (Retire)	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.00
Early Retirement Central Air (EE)	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.00

[97] The calculation of the adjustment can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook.
[98] ADM Associates, Inc. (2009). *Residential Central AC Regional Evaluation*. Prepared for NSTAR, National Grid, Connecticut Light & Power and United Illuminating; Page 4-5, Table 4-3.
[99] Massachusetts Common Assumption: RUL is 1/3 of the EUL.
[100] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group; Page 1-3, Table 1.

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on evaluation study results[101] and Massachusetts Common Assumptions. [102]

[101] ADM Associates, Inc. (2009). *Residential Central AC Regional Evaluation*. Prepared for NSTAR, National Grid, Connecticut Light & Power and United Illuminating; Page 4-12 Table 4-9.
[102] The coincidence factors included in the BC model do not match the coincidence factors that are in the TRM because the B/C model only allows for a single max kW reduction to be entered for each measure and the TRM provides separate summer and winter kW reductions for some measures. An adjustment was made to the coincidence factors in the BC model in order to get the model to calculate the correct summer and winter kW reductions.

HVAC – Window AC Replacement (Retrofit)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Replacement of existing inefficient room air conditioners with more efficient models. This is only offered as a measure when an AC timer would not reduce usage during the peak period.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Cooling
Core Initiative: Electric - Low-Income Single Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results for all programs and PAs except for National Grid's Low Income Multi-Family initiative[103].

Measure Name	Core Initiative	PA	ΔkWh	ΔkW
Window AC Replacement	LI Retrofit 1-4	All	113	0.32
Window AC Replacement	LI MF Retrofit	Eversource, Unitil, CLC	113	0.32

For National Grid's Low Income Multi-Family initiative unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = (Capacity_{existing} / EER_{existing} - Capacity_{new}/EER_{new}) * hours/1000$$
$$\Delta kW = (Capacity_{exisitng}/EER_{existing} - Capacity_{new}/EER_{new}) /1000$$

Where:

$Capacity_{exisitng}$ = size of existing unit in BTUs/hour
$Capacity_{new}$ = size of new unit in BTUs/hour
$EER_{exisitng}$ = Energy Efficiency Ratio of base AC equipment
EER_{new} = Energy Efficiency Ratio of new efficient AC equipment
Hours = Equivalent full load hours= 200[104]

[103] The Cadmus Group, Inc. (2015). *Massachusetts Low-Income Multifamily Initiative Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[104] RLW Analytics (2008). *Coincidence Factor Study: Residential Room Air Conditioners*. Prepared for Northeast Energy Efficiency Partnerships' New England Evaluation and State Program Working Group; Page 32, Table 22 - found by averaging the EFLH values for MA states (Boston and Worcester): (228+172)/2 = 200.

Baseline Efficiency

The baseline efficiency case is the existing air conditioning unit.

High Efficiency

The high efficiency case is the high efficiency room air conditioning unit.

Hours

Not applicable.

Measure Life

The measure life is 9 years.[105]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Window AC Replacement	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	1.00	0.00
Window AC Replacement	LI MF Retrofit	All	1.00	1.00	1.00	1.00	1.00	0.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[106]

HVAC – Air Source Heat Pump

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of high efficiency Air Source Heat Pumps.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heat Pumps
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left[\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}} \right) \times Hours_C + \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}} \right) \times Hours_H \right]$$

$$\Delta kW = \max(\Delta kW_{COOL}, \Delta kW_{HEAT})$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}} \right)$$

$$\Delta kW_H = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}} \right)$$

Where:

Unit	=	Installation of heat pump system
Tons	=	Capacity of HP equipment
$SEER_{BASE}$	=	Seasonal efficiency of baseline HP equipment
$SEER_{EE}$	=	Seasonal efficiency of new efficient HP equipment.
EER_{BASE}	=	Peak efficiency of base HP equipment
EER_{EE}	=	Peak efficiency of new efficient HP equipment.
$HSPF_{BASE}$	=	Heating efficiency of baseline HP equipment
$HSPF_{EE}$	=	Heating efficiency of new efficient HP equipment.
$Hours_C$	=	EFLH for cooling
$Hours_H$	=	EFLH for heating

Savings for Residential Air-Source Heat Pumps[107]

Measure Name	Size (tons)	SEER	EER	HSPF	ΔkW_C	ΔkW_H	ΔkWh
Heat Pump SEER 16.0 HSPF 8.5	2.8	16	13.5	8.5	0.31	0.19	450.3
Heat Pump SEER 18.0 HSPF 9.6	2.8	18	13.8	9.6	0.36	0.65	1,077.8

Baseline Efficiency

The baseline efficiency case is a 2.8 ton air-source heat pump with SEER = 14, EER = 12.2 and HSPF = 8.2 for replace on failure and SEER =10, EER= 8.5 and HSPF = 7.0 for early retirement.

High Efficiency

The high efficiency case is an ENERGY STAR® qualified Air Source Heat Pump.

Hours

Equivalent full load hours are 1200 hours/year for heating[108] and 360 hours/year for cooling.[109]

Measure Life

Measure	Measure Life[110]
Heat Pump SEER 16.0 HSPF 8.5	14
Heat Pump SEER 18.0 HSPF 9.6	16

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

HVAC – Ductless MiniSplit Heat Pump

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a more efficient Ductless Mini Split HP system.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heat Pumps
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh_{HP} = Tons \times \frac{12\ kBtu/hr}{Ton}\left[\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}}\right) \times Hours_C + \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}}\right) \times Hours_H\right]$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

$$\Delta kW_{HEAT} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}}\right)$$

Where:

Unit	=	Installation of high efficiency ductless Mini Split System
ΔkWh_{HP}	=	Reduction in annual kWh consumption of HP equipment
ΔkW_{HP}	=	Reduction in electric demand of HP equipment
Tons	=	Capacity of HP equipment
$SEER_{BASE}$	=	Seasonal efficiency of baseline HP equipment
$SEER_{EE}$	=	Seasonal efficiency of new efficient HP equipment
EER_{BASE}	=	Peak efficiency of base HP equipment[112]
EER_{EE}	=	Peak efficiency of new efficient HP equipment
$HSPF_{BASE}$	=	Heating efficiency of baseline HP equipment
$HSPF_{EE}$	=	Heating efficiency of new efficient HP equipment
$Hours_C$	=	EFLH for cooling
$Hours_H$	=	EFLH for heating

[112] AHRI (Air Conditioning, Heating, and Refrigeration Institute) (2011). Average EER of current in-market equipment with from website at http://www.ahridirectory.org/ahridirectory/pages/home.aspx. Under Directory of Certified Product Performance>Residential>Variable Speed Mini-Split and Multi-Split Heat Pumps. Specified Model Status = Active, Indoor Type = Mini-Splits, and SEER Min and Max of 13 for 2013 and 2014 and Min and Max of 14 for 2015.

Savings for Residential Ductless MiniSplit Heat Pumps[113]

Measure Name	Average Size (tons)	Average SEER	Average EER	Average HSPF	ΔkW_C	ΔkW_H	ΔkWh
Mini Split HP SEER 18.0 HSPF 9	1.36	20.5	13.3	9.9	0.11	0.34	286
Mini Split HP SEER 20.0 HSPF 11	0.98	24.2	13.8	12.0	0.11	0.45	330

Baseline Efficiency

The baseline efficiency case is a non- ENERGY STAR® rated ductless mini split heat pump with SEER 14, EER 10 and HSPF 8.2.

High Efficiency

The high efficiency case is an ENERGY STAR® qualified Ductless Mini Split System. The 2014 rebated average size and efficiency by measure is shown in the table above. The program qualifications are SEER 18.0 and HSPF 9.0 and SEER 20 and HSPF 11. 0.

Hours

The equivalent full load hours are 447 hours/year for heating[114] and 360 hours/year for cooling.[115]

Measure Life

The measure life is 18 years.[116]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[113] The calculation of the adjustment can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook.
[114] The Cadmus Group (2015). *Ductless Mini-Split Heat Pump (DMSHP) Final Heating Season Results*. Prepared for The Electric and Gas Program Administrators of Massachusetts.
[115] ADM Associates, Inc. (2009). *Residential Central AC Regional Evaluation*. Prepared for Eversource (NSTAR), National Grid, Connecticut Light & Power and United Illuminating; Page 4-5, Table 4-3.
[116] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group; Page 1-3, Table 1.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Mini Split HP SEER 18.0 HSPF 9	RHVAC	All	1.00	1.00	1.00	1.00	0.08	0.50
Mini Split HP SEER 20.0 HSPF 11	RHVAC	All	1.00	1.00	1.00	1.00	0.06	0.50

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on evaluation study results and Massachusetts Common Assumptions.[117]

[117] The coincidence factors included in the BC model do not match the coincidence factors that are in the TRM because the B/C model only allows for a single max kW reduction to be entered for each measure and the TRM provides separate summer and winter kW reductions for some measures. An adjustment was made to the coincidence factors in the BC model in order to get the model to calculate the correct summer and winter kW reductions.

HVAC – Early Retirement of Heat Pump Unit

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early replacement of Heat Pump Units
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heat Pumps
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left[\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}} \right) \times Hours_C + \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}} \right) \times Hours_H \right]$$

$$\Delta kW = \max\left(\Delta kW_{COOL}, \Delta kW_{HEAT}\right)$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}} \right)$$

$$\Delta kW_{HEAT} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}} \right)$$

Where:

Unit	=	Replacement of existing inefficient system with new efficient system
Tons	=	Capacity of AC/HP equipment: Current default is 2.8 tons
$SEER_{BASE}$	=	Seasonal efficiency of baseline AC equipment
$SEER_{EE}$	=	Seasonal efficiency of new efficient AC equipment
EER_{BASE}	=	Peak efficiency of base AC equipment
EER_{EE}	=	Peak efficiency of new efficient AC equipment
$HSPF_{BASE}$	=	Heating efficiency of baseline HP equipment
$HSPF_{EE}$	=	Heating efficiency of new efficient HP equipment
$Hours_C$	=	EFLH for cooling
$Hours_H$	=	EFLH for heating

Savings for Early Retirement Heat Pumps[118]

Measure Name	EER_{BASE}	$SEER_{BASE}$	$HSPF_{BASE}$	EER_{EE}	$SEER_{EE}$	$HSPF_{EE}$	ΔkW_C	ΔkW_H	ΔkWh
Early Retirement Heat Pump (Retire)	8.5	10	7.0	12.2	14	8.2	1.20	0.7	1189
Early Retirement Heat Pump (EE) SEER 16	12.2	14	8.2	13.5	16	8.5	0.27	0.145	282
Early Retirement Heat Pump (EE) SEER 18	12.2	14	8.2	13.8	18	9.6	0.32	0.598	909

Baseline Efficiency

The baseline efficiency case for the retire portion is assumed to be a typical 10-12 year-old heat pump unit with SEER 10, EER 8.5, HSPF 7.0. The baseline efficiency case for EE portion is a standard efficiency SEER 14, EER 12.2, HSPF 8.2.

High Efficiency

For the retirement savings over the remaining life of existing AC unit, the efficient case is a SEER 14, EER 12.2, HSPF 8.2 unit. For the high efficiency savings over lifetime of the new unit, the efficient case is either a new high efficiency SEER 16, EER 13.5, 8.5 HSPF unit or a new high efficiency SEER 18, EER 13.8, 9.6 HSPF unit.

Hours

The equivalent full load hours are 1,200 hours per year for heating[119] and 360 hours per year for cooling.[120]

Measure Life

The remaining life for the existing unit is 6 years[121], and the measure life of new equipment is 18 years[122]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[122] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group; Page 1-3, Table 1.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Early Retirement Heat Pump (Retire)	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.293
Early Retirement Heat Pump (EE) SEER 16	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.273
Early Retirement Heat Pump (EE) SEER 18	RHVAC	All	1.00	1.00	1.00	1.00	0.134	0.50

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on evaluation study results[123] and Massachusetts Common Assumptions. [124]

[123] ADM Associates, Inc. (2009). *Residential Central AC Regional Evaluation*. Prepared for NSTAR, National Grid, Connecticut Light & Power and United Illuminating; Page 4-12 Table 4-9.
[124] The coincidence factors included in the BC model do not match the coincidence factors that are in the TRM because the B/C model only allows for a single max kW reduction to be entered for each measure and the TRM provides separate summer and winter kW reductions for some measures. An adjustment was made to the coincidence factors in the BC model in order to get the model to calculate the correct summer and winter kW reductions.

HVAC – Central AC Quality Installation Verification (QIV)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The verification of proper charge and airflow during installation of new Central AC system.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: HVAC O&M
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \frac{1}{SEER} \times Hours \times 5\%$$

$$\Delta kW = Tons \times \frac{12\ kBtu/hr}{Ton} \times \frac{1}{EER} \times 5\%$$

Where:

Units	=	Completed QIV
Tons	=	Cooling capacity of AC equipment: Current default is 2.6 tons
SEER	=	Seasonal efficiency of AC equipment: Default = 16
EER	=	Peak efficiency of AC equipment: Default = 13.0
Hours	=	Equivalent full load hours
5%	=	Average percent demand reduction: 5.0%[125]

Savings for Central Air QIV[126]

Measure Name	ΔkWh	ΔkW
Central Air QIV	35	0.12

Baseline Efficiency

The baseline efficiency case is a cooling system with SEER = 16 and EER = 13.0 whose installation is inconsistent with manufacturer specifications.

[125] Massachusetts Common Assumption.
[126] The calculation can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook.

High Efficiency

The high efficiency case is the same cooling system whose installation is consistent with manufacturer specifications.

Hours

Equivalent full load cooling hours are 360 hours per year.[127]

Measure Life

The measure life is 18 years.[128]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Central Air QIV	RHVAC	All	1.00	1.00	1.00	1.00	0.25	0.00

In-Service Rates
All installations have 100% in service rate.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on evaluation study results[129].

HVAC – Mini Split Heat Pump Quality Installation Verification (QIV)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The verification of proper charge and airflow during installation of new Ductless Heat Pump systems.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: HVAC O&M
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{SEER} \times Hours_C + \frac{1}{HSPF} \times Hours_H \right) \times 5\%$$

$$\Delta kW = \max(\Delta kW_{COOL}, \Delta kW_{HEAT})$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER} \right) \times 5\%$$

$$\Delta kW_{HEAT} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{HSPF} \right) \times 5\%$$

Where:
Unit = Completed QIV
Tons = Cooling capacity of HP equipment: Current default is 1.36 tons
SEER = Seasonal cooling efficiency of HP equipment
EER = Peak cooling efficiency of HP equipment
HSPF = Heating efficiency of HP equipment
$Hours_C$ = EFLH for cooling
$Hours_H$ = EFLH for heating
5% = Average demand reduction: 5%[134]

Savings for Mini Split Heat Pump QIV[135]

Measure Name	ΔkWh	ΔkW
Mini Split Heat Pump QIV	51	0.08

[134] Massachusetts Common Assumption.
[135] The calculation can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook.

Baseline Efficiency

The baseline efficiency case is a ductless mini-split system with SEER = 18and HSPF = 8.5) whose installation is inconsistent with manufacturer specifications.

High Efficiency

The high efficiency case is the same heating and cooling system whose installation is consistent with manufacturer specifications.

Hours

The equivalent full load heating hours are 447[136] hours per year and the equivalent full load cooling hours are 360 hours per year.[137]

Measure Life

The measure life is 18 years.[138]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

HVAC – Heat Pump Digital Check-up/Tune-up

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Tune-up of an existing heat pump system.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: HVAC O&M
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{SEER} \times Hours_C + \frac{1}{HSPF} \times Hours_H \right) \times 5\%$$

$$\Delta kW = \max(\Delta kW_{COOL}, \Delta kW_{HEAT})$$

$$\Delta kW_{COOL} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{EER} \right) \times 5\%$$

$$\Delta kW_{HEAT} = Tons \times \frac{12\ kBtu/hr}{Ton} \times \left(\frac{1}{HSPF} \right) \times 5\%$$

Where:

Unit	=	Completed tune-up
Tons	=	Cooling capacity of HP equipment: Current default is 2.8 tons
SEER	=	Seasonal cooling efficiency of HP equipment
EER	=	Peak cooling efficiency of HP equipment
HSPF	=	Heating efficiency of HP equipment
$Hours_C$	=	EFLH for cooling
$Hours_H$	=	EFLH for heating
5%	=	Average demand reduction: 5%[139]

Savings for Heat Pump Digital Check-up/Tune-Up[140]

Measure Name	ΔkWh	ΔkW
Heat Pump Digital Check-up/Tune-Up	312	0.24

[139] Massachusetts Common Assumption.
[140] The calculation can be found in MA PAs (2015). 2016-2018 Cool Smart Savings Workbook.

Baseline Efficiency

The baseline efficiency case is a system baseline heating and cooling system (SEER = 13 and HSPF = 7.7) that does not operating according to manufacturer specifications.

High Efficiency

The high efficiency case is the same heating and cooling system that does operate according to manufacturer specifications.

Hours

The equivalent full load hours are 1200 hours per year for heating[141] and 360 hours per year for cooling.[142]

Measure Life

The measure life is 5 years[143]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

HVAC – Duct Sealing

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: A 66% reduction in duct leakage from 15% to 5% of supplied CFM.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Ducting
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on results of DOE2 modeling where unit equals a completed job[145].

Savings for Duct Sealing

Measure Name	ΔkWh	ΔkW[146]
Duct Sealing	212	0.30

Baseline Efficiency

The baseline efficiency case is assumes a 15% leakage.

High Efficiency

The high efficiency case is a system with duct leakage reduced by 66% to 5% leakage.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[147]

[145] RLW Analytics (2002). *Market Research for the Rhode Island, Massachusetts, and Connecticut Residential HVAC Market*. Prepared for National Grid, Northeast Utilities, NSTAR, Fitchburg Gas and Electric Light Company and United Illuminating; Page 3, Table 2.

HVAC – Quality Installation with Duct Modification

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: 50% reduction in duct leakage from 20% to 10%. This measure may also include duct modifications.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Ducting
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on results of DOE2 modeling where unit is equal to a completed job[149].

Savings for Quality Installation with Duct Modification

Measure Name	ΔkWh	ΔkW[150]
QI w/ Duct modifications	513	0.85

Baseline Efficiency

The baseline efficiency case is a system with an installation that is inconsistent with manufacturer specifications and may include leaky ducts.

High Efficiency

The high efficiency case is a system with an installation that is consistent with manufacturer specifications and may have reduced duct leakage.

Hours

Not applicable.

Measure Life

The measure life is 18 years.[151]

HVAC – Duct Sealing

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: For existing ductwork in non-conditioned spaces, seal ductwork. This could include sealing leaky fixed ductwork with mastic or aerosol.
Primary Energy Impact: Natural Gas (Residential Heat), Oil, Propane, Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Ducting
Core Initiative: Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Electric – Residential Home Energy Services, Gas – Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results. [153, 154]

Measure Name	Core Initiative	Energy Type	ΔMMBtu	ΔkWh	ΔkW[155]
Duct Sealing	HES	Gas	3.6		
Duct Sealing	HES	Propane	3.6		
Duct Sealing	HES	Oil	4.1		
Duct Sealing	HES	Electric		428	0.23
Duct Sealing	LI 1-4 Retrofit	Gas	3.3		
Duct Seal, Other	LI 1-4 Retrofit	Propane	3.3		
Duct Seal, Oil	LI 1-4 Retrofit	Oil	3.3		

Baseline Efficiency

The baseline efficiency case is existing, non-sealed (leaky) ductwork in unconditioned spaces (e.g. attic or basement)

High Efficiency

The high efficiency condition is air sealed ductwork in unconditioned spaces.

HVAC – Duct Sealing

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Ducts are sealed by reconnecting disconnected duct joints and sealing gaps or seams with mastic and fiber-mesh tape as appropriate
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Ducting
Core Initiative: Gas – Residential Multi-Family Retrofit, Gas – Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta MMBtu = AnnualHeatingConsumption \times \%SAVE \times \frac{1}{1{,}000{,}000}$$

Where:
AnnualHeatingConsumption = The total annual heating consumption for the facility (Btu)
%SAVE = Average reduction in energy consumption.
1/1,000,000 = Conversion from Btu to MMBtu

Savings Factors for Multifamily Duct Sealing

Measure Type	%SAVE[158]
Surface Area < 50 SQFT	7%
Surface Area > 50 SQFT and < 200 SQFT	3%
Surface Area > 200 SQFT	1%

Baseline Efficiency

The baseline efficiency case is the existing facility or equipment prior to the implementation of duct sealing.

High Efficiency

The baseline efficiency case is the existing facility or equipment after the implementation of duct sealing.

[158] Savings assumptions from National Grid program vendor.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[159]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Duct Sealing	MF Retrofit	National Grid	1.00	1.00	n/a	n/a	n/a	n/a
Duct Sealing	LI MF Retrofit	National Grid	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates
The energy realization rate is 100% based on no evaluations.

Coincidence Factors
There are no electric savings for this measure.

[159] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group.

HVAC – Duct Insulation

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: For existing ductwork in non-conditioned spaces, insulate ductwork.
Primary Energy Impact: Natural Gas (Residential Heat), Oil, Propane, Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Ducting
Core Initiative: Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Electric – Residential Home Energy Services, Gas – Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.[160, 161]

Measure Name	Core Initiative	Energy Type	ΔMMBtu	ΔkWh	ΔkW[162]
Duct Insulation, Gas; Duct Insulation	HES	Gas	6.8		
Duct Insulation, Other	HES	Propane	6.8		
Duct Insulation, Oil	HES	Oil	7.7		
Duct Insulation, Electric	HES	Electric		1,613	0.90
Duct Insulation	LI 1-4 Retrofit	Gas	5.5		
Duct Insulation, Other	LI 1-4 Retrofit	Propane	5.5		
Duct Insulation, Oil	LI 1-4 Retrofit	Oil	4.3		

Baseline Efficiency

The baseline efficiency case is existing, non-sealed (leaky) ductwork in unconditioned spaces (e.g. attic or basement)

High Efficiency

The high efficiency condition is air sealed ductwork in unconditioned spaces.

HVAC – Furnace Fan Motors (electrically efficient fan motors)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of high efficiency motors on residential furnace fans, including electronically commutated variable speed air supply motors.
Primary Energy Impact: Electric
Secondary Energy Impact: Natural Gas (Residential Heat)
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Motors
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[165].

Savings for Furnace Fan Motors

Measure Name	ΔkWh	ΔkW[166]
Furnace ECM	168	0.12

Baseline Efficiency

The baseline efficiency case is the installation of a furnace with a standard efficiency steady state motor.

High Efficiency

The high efficiency case is the installation of a furnace with an electronically commutated motor.

Hours

Not applicable.

[165] The Cadmus Group, Inc. (2012). *Brushless Fan Motors Impact Evaluation*. Prepared for: The Electric and Gas Program Administrators of Massachusetts. The savings values for the BFM come from Page 1, Table 1 of the BFM impact evaluation filed with the Annual Report. While this report was only to provide savings for the BFM --the original savings used by the PA's 600 kWh and .116 kW were used for both the BFM and electrically efficient fan motors. When the BFM study was almost complete we asked the evaluation team if it were possible to come up with savings for the electrically efficient fan motors motor; they calculated the 168 kWh using data from the BFM onsites, after several discussions the evaluation team determined the electrically efficient fan motors motor was a different measure than the BFM so the calculations were not 100% accurate. They note that while the 600 kWh was too high, the 168 may be on the low side but could not confirm without an evaluation of the electrically efficient fan motors. PA's determined while we did not have an evaluation for the 168 it was probably a more realistic number than the 600.
[166] Ibid

Measure Life

The measure life for the electrically efficient fan motors is assumed to be the same as the furnace it is installed on which is 18 years.[167]

Secondary Energy Impacts

A heating penalty results due to reduced heat loss of the efficient furnace motor.

Measure	Core Initiative	PA Type	Energy Type	ΔMMBtu/Unit[168]
Furnace ECM	RHVAC	Elec	Natural Gas (Residential Heat)	-0.716

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Furnace ECM	RHVAC	All	1.00	1.00	1.00	1.00	0. 00	0.16

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based evaluation results[169].

HVAC – Pipe Wrap

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Insulation upgrades to existing heating system pipes
Energy Impact: Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Retrofit
End Use: HVAC
Measure Type: Insulation
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Gas - Multi-Family Retrofit, Gas – Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results [170,171]. For HES unit is a household with pipe wrap installed on heating pipes. For Multifamily programs, units are in linear feet of insulation installed.

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
Pipe Wrap (Heating), Gas; Pipe Wrap (Heating)	HES	Gas	1.3
Pipe Wrap (Heating), Oil	HES	Oil	1.4
Pipe Wrap (Heating), Other	HES	Propane	1.3
Pipe Wrap (Heating)	MF Retrofit	Oil	0.16
Pipe Wrap (Heating)	MF Retrofit	Propane	0.16
Pipe Wrap (Heating)	MF Retrofit	Gas	0.16
Pipe Wrap (Heating)	LI MF Retrofit	Oil	0.16
Pipe Wrap (Heating)	LI MF Retrofit	Gas	0.16

Baseline Efficiency

The baseline efficiency case is the existing equipment prior to the implementation of additional insulation.

High Efficiency

The high efficiency case includes pipe insulation.

[170] The Cadmus Group, Inc. (2012). *Home Energy Services Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[171] Savings assumptions for Multifamily programs are from National Grid program vendor.

Hours

Not applicable.

Measure Life

The measure life is 15 years.[172]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Pipe Wrap (Heating)	HES	All	1.00	1.00	n/a	n/a	n/a	n/a
Pipe Wrap (Heating)	MF Retrofit	All	1.00	0.60	n/a	n/a	n/a	n/a
Pipe Wrap (Heating)	LI MF Retrofit	National Grid	1.00	0.75	n/a	n/a	n/a	n/a
Pipe Wrap (Heating)	LI MF Retrofit	Eversource	1.00	1.05	n/a	n/a	n/a	n/a
Pipe Wrap (Heating)	LI MF Retrofit	Columbia	1.00	0.96	n/a	n/a	n/a	n/a
Pipe Wrap (Heating)	LI MF Retrofit	Unitil	1.00	0.96	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
For HES the realization rate is set to 100% since deemed savings are based on evaluation results. For LI MF Retrofit the realization rates are based on evaluation results.[173] For MF Retrofit the realization rates are based on draft evaluation results.

Coincidence Factors
Coincidence factors are set to zero since there are no electric savings for this measure.

[172] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group; Page 1-3, Table 1.

HVAC – Programmable Thermostats

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a programmable thermostat, which gives the ability to adjust heating or air-conditioning operating times according to a pre-set schedule.
Primary Energy Impact: Electric, Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Gas - Residential Heating & Cooling Equipment, Electric - Low-Income Single Family Retrofit, Gas - Residential Multi-Family Retrofit, Gas - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results. [174,175,176,177]

Savings for Programmable Thermostats

Measure Name	Core Initiative	PA Type	Energy Type	ΔkWh	ΔkW[178]	ΔMMBtu
Programmable Thermostat, Electric	HES	Elec	Electric	330	0.18	
Programmable Thermostat, Oil	HES	Elec	Oil			3.4

178 Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Measure Name	Core Initiative	PA Type	Energy Type	ΔkWh	ΔkW[178]	ΔMMBtu
Programmable Thermostat, Electric Resistance, With AC	MF Retrofit	Elec	Electric	281	0.13	
Programmable Thermostat, AC Only	MF Retrofit	Elec	Electric	25	0.06	
Programmable Thermostat, Heat Pump	MF Retrofit	Elec	Electric	241	0.10	
Programmable Thermostat, Oil	MF Retrofit, LI MF Retrofit	Elec	Oil			2.3
Programmable Thermostat	MF Retrofit, LI MF Retrofit	Gas	Gas			2.3
Programmable Thermostat, Electric	LI MF Retrofit	Elec	Electric	257	0.13	

Baseline Efficiency

The baseline efficiency case is an HVAC system without a programmable thermostat.

High Efficiency

The high efficiency case is an HVAC system that has a programmable thermostat installed.

Hours

Not applicable.

Measure Life

The measure life is 15 years.[179] For Multifamily Retrofit the measure persistence was estimated to be 69%[180] so the effective measure life is 10 years (15 years * 69%).

Secondary Energy Impacts

For Gas - Residential Multi-Family Retrofit:

If facility has central cooling then also calculate air conditioning savings.

$$\Delta kWh = kWh_{cool} \times \%savings$$

Where:

kWh_{cool} = Average kWh consumption of the air conditioning system: 397 kWh[181]

%savings = Energy savings percent from installation of programmable thermostats, deemed at 6.2%.[182]

Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Gas - Residential Heating & Cooling Equipment, Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Gas - Residential Multi-Family Retrofit, Gas - Low-Income Multi-Family Retrofit, Electric - Residential Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[186].

Savings for Wi-Fi Thermostats

Measure Name	Core Initiative	PA Type	Energy Type	ΔkWh	ΔkW[187]	ΔMMBtu
Wi-Fi Thermostat (controls gas heat only); Wi-Fi Thermostat	RHVAC, HES, LI 1-4 Retrofit	Gas	Gas			6.6
Wi-Fi Thermostat (controls elec cooling & gas heat); Wi-Fi Thermostat (also controls elec cooling)	RHVAC, HES, LI 1-4 Retrofit	Gas	Gas	104	0.23	6.6
Wi-Fi Thermostat, Electric (AC Only)	HES, LI 1-4 Retrofit	Elec	Electric	104	0.23	
Wi-Fi Thermostat, Gas	HES, LI 1-4 Retrofit	Elec	Gas			6.6
Wi-Fi Thermostat, Gas with AC	HES, LI 1-4 Retrofit	Elec	Gas	104	0.23	6.6
Wi-Fi Thermostat, Oil	HES, LI 1-4 Retrofit	Elec	Oil			6.6
Wi-Fi Thermostat, Oil with AC	HES, LI 1-4 Retrofit	Elec	Oil	104	0.23	6.6
Wi-Fi Thermostat, Other	HES, LI 1-4 Retrofit	Elec	Propane			6.6
Wi-Fi Thermostat, Other with AC	HES, LI 1-4 Retrofit	Elec	Propane	104	0.23	6.6

[186] The Cadmus Group (2011). Memo: Wi-fi Programmable Thermostat Billing Analysis. Prepared for Keith Miller and Whitney Domigan, National Grid
[187] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Measure Name	Core Initiative	PA Type	Energy Type	ΔkWh	ΔkW[187]	ΔMMBtu
Wi-Fi Thermostat (controls gas heat only); Wi-Fi Thermostat	RHVAC, HES, LI 1-4 Retrofit	Gas	Gas			6.6
Wi-Fi Thermostat (controls elec cooling & gas heat); Wi-Fi Thermostat (also controls elec cooling)	RHVAC, HES, LI 1-4 Retrofit	Gas	Gas	104	0.23	6.6
Wi-Fi Thermostat, Electric (AC Only)	MF Retrofit, LI MF Retrofit	Elec	Electric	74.8	0.155	
Wi-Fi Thermostat, Oil	MF Retrofit, LI MF Retrofit	Elec	Oil			4.7
Wi-Fi Thermostat (controls gas heat only)	MF Retrofit, LI MF Retrofit	Gas	Gas			4.7
Wi-Fi Thermostat (controls elec cooling & gas heat)	MF Retrofit, LI MF Retrofit	Gas	Gas	74.8	0.155	4.7

Baseline Efficiency

The baseline efficiency case is an HVAC system with either a manual or a programmable thermostat.

High Efficiency

The high efficiency case is an HVAC system that has a Wi-Fi thermostat installed.

Hours

Not applicable.

Measure Life

The measure life is 15 years.[188]

Secondary Energy Impacts

When the thermostat also controls the cooling system the electric savings are 104 kWh[189] and 0.231 kW[190] in Single-Family and 74.8 kWh and 0.155 kW in Multi-Family.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[188] Assumed to have the same lifetime as a regular programmable thermostat. Environmental Protection Agency (2010). *Life Cycle Cost Estimate for ENERGY STAR Programmable Thermostat*.
[189] Electric savings based on staff analysis with savings assumptions from Cadmus.
[190] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators

Impact Factors for Calculating Adjusted Gross Savings

Wi-Fi Thermostat (controls elec cooling & gas heat)	MF Retrofit	All	1.00	0.60	1.00	1.00	1.00	0.00

In-Service Rates
All PAs assume 100% in service rate.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results. For MF Retrofit the realization rate is based on draft evaluation results.

Coincidence Factors
Summer and winter coincidence factors are estimated using demand allocation methodology described the Cadmus Demand Impact Model.[191]

HVAC – Boiler Reset Control

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Boiler Reset Controls are devices that automatically control boiler water temperature based on outdoor or return water temperature using a software program.
Primary Energy Impact: Oil, Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Heating & Cooling Equipment, Electric - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results. [192,193]

Savings for Boiler Reset Controls

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
Boiler Reset Control, Oil	HES	Oil	4.7
Boiler Reset Control, Other	HES	Propane	4.5
Boiler Reset Control	RHVAC	Gas	4.5
Boiler Reset Controls, Oil	LI Retrofit 1-4	Oil	4.4

Baseline Efficiency

The baseline efficiency case is a boiler without reset controls.

High Efficiency

The high efficiency case is a boiler with reset controls.

Hours

Not applicable.

[193] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Measure Life

The measure life is 15 years.[194]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	PA Type	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Boiler Reset Controls	HES	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a
Boiler Reset Controls	RHVAC	All	Gas	1.00	1.00	n/a	n/a	n/a	n/a
Boiler Reset Controls	LI Retrofit 1-4	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Heat Recovery Ventilator

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Heat Recovery Ventilators (HRV) can help make mechanical ventilation more cost effective by reclaiming energy from exhaust airflows.
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Ventilation
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[195].

Savings for Heat Recovery Ventilator

Measure Name	ΔMMBtu/Unit
Heat Recovery Ventilator	7.7

Baseline Efficiency

The baseline efficiency case is an ASHRAE 62.2-compliant exhaust fan system with no heat recovery.

High Efficiency

The high efficiency case is an exhaust fan system with heat recovery.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[196]

Secondary Energy Impacts

An electric penalty results due to the electricity consumed by the system fans.

HVAC – ECM Circulator Pump

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of high efficiency residential boiler circulator pumps, including electronically commutated variable speed air supply motors.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Motors
Core Initiative: Electric - Residential Cooling & Heating Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[200].

Savings for ECM Circulator Pump

Measure Name	ΔkWh	ΔkW[201]
Circulator Pump	142	0.08

Baseline Efficiency

The baseline efficiency case is the installation of a standard circulator pump.

High Efficiency

The high efficiency case is the installation of an ECM circulator pump.

Hours

Not applicable.

Measure Life

The measure life is 15 years. [202]

[200] The Cadmus Group (2012). *Impact Evaluation of the 2011-2012 ECM Circulator Pump Pilot Program.* Savings Values shown in MA PAs (2015). ECM Circulator Pump Savings Calculations Workbook.

Circulator Pump	RHVAC	All	1.00	1.00	1.00	1.00	0. 00	0.16

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based evaluation results[203].

[203] Ibid.

HVAC – Combo Condensing Boiler/Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of a combined high-efficiency boiler and water heating unit. Combined boiler and water heating systems are more efficient than separate systems because they eliminate the standby heat losses of an additional tank.
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.[204]

Savings for Combination Water Heater/Boiler

Measure Name	ΔMMBtu/Unit
Combo Condensing Boiler/Water Heater 90%	10.3
Combo Condensing Boiler/Water Heater 95%	12.8

Baseline Efficiency

The baseline efficiency case is an 82% AFUE rated boiler (79.3% AFUE actual) with a 0.6 EF water heater. The ER baseline is an 80% AFUE rated boiler (77.4% AFUE actual) with either an indirect water heater or with a 0.55 EF water heater. 80% were indirect and 20% were storage water heaters.

High Efficiency

The high efficiency case is either an integrated water heater/boiler unit with a 90% AFUE condensing boiler (actual was 87.2% and a 0.9 EF water heater (actual was 87.2%) or a 95% AFUE condensing boiler (actual was 89.4%) and a 0.95 EF water heater(actual was 89.4% .

[204] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts. Savings have been adjusted to reflect the mix of replace on failure and early replacement based on: The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. Prepared for the Electric and Gas Program Administrators of Massachusetts. The calculation of the adjustment can be found in MA PAs (2015). 2016-2018 HEHE Savings Workbook.

Hours

Not applicable.

Measure Life

The measure life is 19 years.[205]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Combo Condensing Boiler/Water Heater 90%	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a
Combo Condensing Boiler/Water Heater 95%	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[205] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Qualified Boiler*; measure life assumed to be the same as a boiler. Lifetime has been adjusted to reflect the mix of replace on failure and early replacement based on: The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. HVAC – Boiler, Gas Forced Hot Water

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a new high efficiency gas-fired boiler for space heating.
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated based on deemed inputs and have been adjusted to reflect the mix of replace on failure and early replacement.[206]

Savings for Residential Boilers

Measure Name	Energy Type	ΔMMBtu
Boiler 90%	Gas	11.4
Boiler 95%	Gas	14.1

Baseline Efficiency

The baseline efficiency case is an 82% AFUE rated boiler (79.3% AFUE actual). The ER baseline is an 80% AFUE rated boiler (77.4% AFUE actual).

High Efficiency

The high efficiency case is a boiler with an AFUE rating of 90% or greater. Based on evaluation results the actual AFUE is 87.2% for a 90% AFUE rated boiler and 89.4% for a 95% AFUE rated boiler.

Hours

Not applicable.

[206] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts Savings have been adjusted to reflect the mix of replace on failure and early replacement based on: The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. Prepared for the Electric and Gas Program Administrators of Massachusetts. The calculation of the savings including this adjustment can be found in MA PAs (2015). 2016-2018 HEHE Savings Workbook.

Measure Life

The measure life is 20 years.[207]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

HVAC – Boiler, Oil/Propane Forced Hot Water

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a new high efficiency boiler for space heating.
Primary Energy Impact: Oil, Propane
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated based on deemed inputs.

ΔMMBtu = heating load MMBTUs * (1/AFUE base – 1/AFUEee)

Where:
Heating load = 96.51 MMBTUs[208]

Measure Name	Energy Type	ΔMMBtu/unit
Heating System Replacement (Boiler), Oil	Oil	2.7
Heating System Replacement (Boiler), Other	Propane	11.4

Baseline Efficiency

For oil the baseline efficiency case is a code compliant oil AFUE 84%[209] boiler. For propane the baseline is a code-compliant boiler (AFUE = 82%) adjusted by a degradation factor (0.967) to account for its metered efficiency (AFUE=79.3%).[210]

High Efficiency

For oil the high efficiency case is a new 86% AFUE oil boiler. For propane the high efficiency case AFUE 93% adjusted by a degradation factor (0.941) to account for its metered efficiency (AFUE=87.5%).[211]

[211] Ibid.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[212]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Heating System Replacement (Boiler), Oil	HES	All	1.00	1.00	n/a	n/a	n/a	n/a
Heating System Replacement (Boiler), Other	HES	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

212 Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Qualified Boiler*.

HVAC – Furnace, Gas

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a new high efficiency space heating furnace with an electronically commutated motor (ECM) for the fan.
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated based on deemed inputs and have been adjusted to reflect the mix of replace on failure and early replacement.[213]

Savings for Residential Furnaces

Measure Name	Energy Type	ΔMMBtu
Furnace w/ECM 95%	Gas	8.1
Furnace w/ECM 97%	Gas	9.2

Baseline Efficiency

For the replace on failure portion the baseline efficiency case is an 85% AFUE furnace.[214] For the early retirement portion the baseline efficiency is a 78% AFUE furnace (Actual 78.9% AFUE).

High Efficiency

The high efficiency case is either a new furnace with AFUE >= 95% (actual 95.4% AFUE) with an electronically commutated motor installed or AFUE >= 97% (Actual 97.2% AFUE) with an electronically commutated motor installed.

[213] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts Savings have been adjusted to reflect the mix of replace on failure and early replacement based on: The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. Prepared for the Electric and Gas Program Administrators of Massachusetts. The calculation of the savings including this adjustment can be found in MA PAs (2015). 2016-2018 HEHE Savings Workbook.

[214] Agreed upon value with EEAC consultants

Hours

Not applicable.

Measure Life

The measure life is 17 years.[215]

Secondary Energy Impacts

High efficiency furnaces equipped with ECM fan motors also save electricity from reduced fan energy requirements. See HVAC - Furnace Fan Motors (ECM).

ΔkWh = Average annual energy reduction per unit: 168 kWh
ΔkW = Average demand reduction per unit: 0.124 kW

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Program	PA	PA Type	ISR	SPF	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Furnace w/ECM 95%	RHVAC	All	Gas	1.00	1.00	1.00	1.00	1.00	0.00	0.16
Furnace w/ECM 97%	RHVAC	All	Gas	1.00	1.00	1.00	1.00	1.00	0.00	0.16

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Savings Persistence Factor
All PAs use 100% savings persistence factor.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Coincident factors are based on evaluation results. See HVAC - Furnace Fan Motors (ECM).

[215] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Furnace*. Lifetime has been adjusted to reflect the mix of replace on failure and early replacement based on: The Cadmus Group (2013). *2012 Residential Heating, Water Heating, and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing*. HVAC – Furnace, Oil/Propane

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a new high efficiency space heating furnace. Electric savings can be attributed to reduced fan run time.
Primary Energy Impact: Oil, Propane
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated based on deemed inputs.

ΔMMBtu = heating load MMBTUs * (1/AFUE base – 1/AFUEee)

Where:
Heating load = 58.35 MMBTUs[216]

Measure Name	Energy Type	ΔMMBtu/unit
Heating System Replacement (Furnace), Oil	Oil	2.5
Heating System Replacement (Furnace), Other	Propane	7.2

Baseline Efficiency

The baseline efficiency case is a code compliant oil furnace, AFUE 83%[217], or an 85% AFUE[218] propane furnace.

High Efficiency

The high efficiency case is a new 86% AFUE oil furnace or a 95% AFUE propane furnace.

Hours

Not applicable.

Measure Life

The measure life is 18 years.[219]

Secondary Energy Impacts

For oil furnaces electric savings can be attributed to reduced fan run time. The unit savings are deemed based on study results. Propane high efficiency furnaces equipped with ECM fan motors also save electricity from reduced fan energy requirements. See HVAC - Furnace Fan Motors (ECM).

Measure Name	ΔkWh/unit	ΔkW/unit
Heating System Replacement (Furnace), Oil	98[220]	0.05[221]
Heating System Replacement (Furnace), Other	168	0.12

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Heating System Replacement (Furnace), Oil	HES	All	1.00	1.00	1.00	1.00	0.00	1.00
Heating System Replacement (Furnace), Other	HES	All	1.00	1.00	1.00	1.00	0.00	0.16

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
- For Heating System Replacement (Furnace), Oil the summer and winter coincidence factors are estimated using demand allocation methodology described the Cadmus Demand Impact Model.[222]
- Heating System Replacement (Furnace), Other the coincident factors are based on evaluation results. See HVAC - Furnace Fan Motors (ECM).

HVAC – Early Retirement Boiler, Forced Hot Water

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early retirement of inefficient forced hot water boiler and the installation of new high efficiency forced hot water boiler.
Primary Energy Impact: Natural Gas (Residential Heat), Oil, Propane
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Home Energy Services, Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings for the early replacement of an existing boiler with a high efficiency boiler are counted in two parts: (1) early retirement savings for a code-compliant boiler compared to the existing boiler over the remaining lifetime of the existing boiler, and (2) efficiency savings for the high efficiency boiler compared to a code-compliant boiler for the full life of the new high efficiency boiler:

$$\Delta MMBtu = \Delta MMBtu_{RETIRE} + \Delta MMBtu_{EE}$$

$\Delta MMBtu_{RETIRE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*
$\Delta MMBtu_{EE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*

Where:

Unit	=	Removal of existing inefficient boiler and installation of new high efficiency boiler
$\Delta MMBtu_{RETIRE}$	=	Annual MMBtu savings of code-compliant boiler compared to existing boiler
$\Delta MMBtu_{EE}$	=	Annual MMBtu savings of high efficiency boiler compared to code-compliant boiler
Heating Load	=	96.51 MMBTUs for homes with boilers[223]

[223] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Measure Name	Energy Type	MMBTU/unit[224]
Early Retirement Boiler, Forced Hot Water (EE)	Gas	11.4
Early Retirement Boiler, Forced Hot Water (Retire)	Gas	7.0
Early Retirement Boiler, Forced Hot Water (EE), Oil	Oil	2.7
Early Retirement Boiler, Forced Hot Water (Retire), Oil	Oil	13.8
Early Retirement Boiler, Forced Hot Water (EE), Other	Propane	11.4
Early Retirement Boiler, Forced Hot Water (Retire), Other	Propane	7.0

Baseline Efficiency

For the retirement savings over the remaining life of existing boiler, the baseline is the existing inefficient boiler estimated to be 75% AFUE for a forced hot water boiler. For the high efficiency unit savings over lifetime of the new boiler, the baseline for gas and propane boilers is a code-compliant boiler (AFUE = 82%) adjusted by a degradation factor (0.967) to account for its metered efficiency (AFUE=79.3%)[225]. For oil boilers the baseline is a code-compliant 84% AFUE boiler.

High Efficiency

For the retirement savings over the remaining life of existing boiler, the efficient case for gas and propane boilers is a code-compliant boiler (AFUE = 82%) adjusted by a degradation factor (0.967) to account for its metered efficiency (AFUE = 79.3%). For oil boilers the efficient case is a code-compliant 84% AFUE boiler. For the high efficiency savings over lifetime of the new boiler, the efficient case for gas and propane boilers is a new high efficiency boiler AFUE >= 93%) adjusted by a degradation factor (0.941) to account for its metered efficiency (AFUE >= 87.5%)[226]. For oil the efficient case is an 86% AFUE boiler.

Hours

Not applicable.

Measure Life

The remaining life for the existing unit is 10 years[227], and the measure life of new equipment is 20 years.[228]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[224] Calculated using information provided in The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Early Retirement Boiler, Forced Hot Water (Retire), Other	HES	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Early Retirement Boiler, Steam

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early retirement of inefficient steam boiler and the installation of new high efficiency steam boiler.
Primary Energy Impact: Natural Gas (Residential Heat), Oil, Propane
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Home Energy Services, Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings for the early replacement of an existing boiler with a high efficiency boiler are counted in two parts: (1) early retirement savings for a code-compliant boiler compared to the existing boiler over the remaining lifetime of the existing boiler, and (2) efficiency savings for the high efficiency boiler compared to a code-compliant boiler for the full life of the new high efficiency boiler:

$$\Delta MMBtu = \Delta MMBtu_{RETIRE} + \Delta MMBtu_{EE}$$

$\Delta MMBtu_{RETIRE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*
$\Delta MMBtu_{EE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*

Where:

Unit	=	Removal of existing inefficient boiler and installation of new high efficiency boiler
$\Delta MMBtu_{RETIRE}$	=	Annual MMBtu savings of code-compliant boiler compared to existing boiler
$\Delta MMBtu_{EE}$	=	Annual MMBtu savings of high efficiency boiler compared to code-compliant boiler
Heating Load	=	96.51 MMBTUs for homes with boilers[229]

[229] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Measure Name	Energy Type	MMBTU/unit[230]
Early Retirement Boiler, Steam (EE)	Gas	2.9
Early Retirement Boiler, Steam (Retire)	Gas	8.0
Early Retirement Boiler, Steam (EE), Oil	Oil	2.8
Early Retirement Boiler, Steam (Retire), Oil	Oil	11.0
Early Retirement Boiler, Steam (EE), Other	Propane	2.9
Early Retirement Boiler, Steam (Retire), Other	Propane	8.0

Baseline Efficiency

For the retirement savings over the remaining life of existing boiler, the baseline is the existing inefficient boiler estimated to be 75% AFUE for a forced hot water boiler. For the high efficiency unit savings over lifetime of the new boiler, the baseline for gas and propane boilers is a code-compliant 80% AFUE boiler. For oil boilers the baseline is a code-compliant 82% AFUE boiler.

High Efficiency

For the retirement savings over the remaining life of existing boiler, the efficient case for gas and propane boilers is a code-compliant 80% AFUE boiler and for oil boilers it is a code-compliant 82% AFUE boiler. For the high efficiency savings over lifetime of the new boiler, the efficient case for gas and propane boilers is a new high efficiency 82% AFUE boiler and for oil it is an 84% AFUE boiler.

Hours

Not applicable.

Measure Life

The remaining life for the existing unit is 10 years[231], and the measure life of new equipment is 20 years.[232]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[230] Calculated using information provided in The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[231] Agreed upon with EEAC consultants as a reasonable approximation for the number of years an existing boiler would continue to operate if it had not been replaced early due to the program.
[232] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Qualified Boilers*.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	PA Type	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}

Early Retirement Boiler, Steam (Retire), Oil	HES	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a
Early Retirement Boiler, Steam (EE), Other	HES	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a
Early Retirement Boiler, Steam (Retire), Other	HES	All	Elec	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Early Retirement Furnace

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early retirement of inefficient furnace and installation of new high efficiency furnace
Primary Energy Impact: Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas - Residential Home Energy Services, Electric - Residential Home Energy Services

Algorithms for Calculating Primary Energy Impact

Unit savings for the early replacement of an existing furnace with a high efficiency furnace are counted in two parts: (1) early retirement savings for a code-compliant furnace compared to the existing furnace over the remaining lifetime of the existing furnace, and (2) efficiency savings for the high efficiency furnace compared to a code-compliant furnace for the full life of the new high efficiency furnace:

$$\Delta MMBtu = \Delta MMBtu_{RETIRE} + \Delta MMBtu_{EE}$$

$\Delta MMBtu_{RETIRE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*
$\Delta MMBtu_{EE}$= *heating load MMBTUs * (1/AFUE base – 1/AFUEee)*

Where:

Unit	=	Removal of existing inefficient furnace and installation of new high efficiency furnace
$\Delta MMBtu_{RETIRE}$	=	Annual MMBtu savings of code-compliant furnace compared to existing furnace
$\Delta MMBtu_{EE}$	=	Annual MMBtu savings of high efficiency furnace compared to code-compliant furnace
Heating Load	=	58.3 MMBTUs for homes with furnace [233]

[233] The Cadmus Group (2015). *High Efficiency Heating Equipment Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Savings for Early Retirement Furnaces

Measure Name	Energy Type	MMBTU/unit[234]
Early Retirement Furnace, (EE)	Gas	7.2
Early Retirement Furnace, (Retire)	Gas	6.2
Early Retirement Furnace (EE), Oil	Oil	2.5
Early Retirement Furnace (Retire), Oil	Oil	4.5
Early Retirement Furnace (EE), Other	Propane	7.2
Early Retirement Furnace (Retire), Other	Propane	6.2

Baseline Efficiency

For the retirement savings over the remaining life of existing furnace, the baseline is the existing inefficient furnace estimated to be 78% AFUE. For the high efficiency unit savings over lifetime of the new furnace, for gas and propane the baseline is an 85% AFUE furnace and for oil the baseline is an 83% AFUE furnace.

High Efficiency

For the retirement savings over the remaining life of existing furnace, the efficient case for gas and propane is an 85% AFUE furnace for oil it is an 83% AFUE furnace. For the high efficiency savings over the lifetime of the new furnace, the efficient case for gas and propane is a new high efficiency AFUE 95% furnace and for oil it is an 86% AFUE furnace.

Hours

Not applicable.

Measure Life

The remaining life for the existing unit is 6 years[235], and the measure life of new equipment is 18 years.[236]

Secondary Energy Impacts

High efficiency furnaces equipped with ECM fan motors also save electricity from reduced fan energy requirements. See HVAC - Furnace Fan Motors.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Coincident factors are based on evaluation results. See HVAC - Furnace Fan Motors

HVAC – Boiler Retrofit

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Replacement of an old inefficient space heating boiler with a new boiler.
Primary Energy Impact: Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Gas- Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.[237]

Measure Name	PA	PA Type	Energy Type	ΔMMBtu
Heating System Retrofit, Boiler, Oil	All	Elec	Oil	20.4
Heating System Retrofit, Boiler, Other	All	Elec	Propane	19.4
Heating System Retrofit, Boiler	All	Gas	Gas	19.4

Baseline Efficiency

The baseline efficiency case is the existing inefficient furnace

High Efficiency

The high efficiency case is the new efficient furnace.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[238]

[237] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[238] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Boiler.*

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Furnace Retrofit

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Replacement of an old inefficient space heating furnace with a new furnace.
Primary Energy Impact: Oil, Propane, Natural Gas (Residential Heat)
Secondary Energy Impact: Electric
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.[239]

Measure Name	PA	PA Type	Energy Type	ΔMMBtu/unit
Heating System Retrofit, Furnace, Oil	All	Elec	Oil	14.3
Heating System Retrofit, Furnace, Other	All	Elec	Propane	20.7
Heating System Retrofit, Furnace	All	Gas	Gas	20.7

Baseline Efficiency

The baseline efficiency case is the existing inefficient furnace

High Efficiency

The high efficiency case is the new efficient furnace.

Hours

Not applicable.

Measure Life

The measure life is 18 years.[240]

[239] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[240] Environmental Protection Agency (2009). *Life Cycle Cost Estimate for ENERGY STAR Furnace.*

Secondary Energy Impacts

Electric savings can be attributed to reduced fan run time. The unit savings are deemed based on study results[241]

Measure	PA Type	ΔkWh/unit	ΔkW/Unit[242]
Heating System Retrofit, Furnace, Oil	Elec	132	0.07
Heating System Retrofit, Furnace, Other	Elec	172	0.09
Heating System Retrofit, Furnace	Gas	172	0.09

HVAC – Heating System

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of high efficiency heating equipment to replace the existing inefficient furnace, hydronic boiler or steam boiler.
Primary Energy Impact: Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: Gas- Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta MMBtu = \frac{Btu}{hr} \times \left(\frac{1}{AFUE_{BASE}} - \frac{1}{AFUE_{EE}} \right) \times EFLH_{Heat} \times \frac{1}{1{,}000{,}000}$$

Where:

Btu/hr	=	Nominal heating capacity of the installed equipment (Btu/hr)
$AFUE_{BASE}$	=	Average fuel utilization efficiency of the existing equipment (%)
$AFUE_{EE}$	=	Average fuel utilization efficiency of the efficient equipment (%)
$EFLH_{Heat}$	=	Equivalent full load heating hours for the facility (Hr)
1/1,000,000	=	Conversion from Btu to MMBtu

Baseline Efficiency

The baseline efficiency is determined based on the type of heating equipment installed. For boilers it is 75% AFUE and for furnaces it is 78% AFUE..

High Efficiency

The high efficiency case is characterized by the rated efficiency ($AFUE_{EE}$) of the new high efficiency furnace or boiler.

Hours

The equivalent full load hours are assumed to be 1,418 for all multi-family residential facilities in Massachusetts.

Measure Life

Measure Name	Lifetime (years)
Heating System Retrofit, Boiler	20 [244]
Heating System Retrofit, Furnace	18 [245]
Heating System Retrofit, Commercial Boiler	25

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Program	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}

Lighting – CFL Bulbs

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Compact fluorescent lamps offer comparable luminosity to incandescent and halogen lamps at significantly less wattage and significantly longer lamp lifetimes.
Primary Energy Impact: Electric
Secondary Energy Impact: Natural Gas (Residential Heat)
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Lost Opportunity, Retrofit
End Use: Lighting
Measure Type: Interior
Core Initiative: Residential Lighting, Residential New Construction, Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using deemed inputs based on study results:

$$\Delta kW = \Delta watts \; / 1000$$
$$\Delta kWh = \Delta kW * hours$$

Where:
ΔkW = Average kW reduction[247,248]
hours = Hours of use[249]

Factors for Calculating Savings for Residential CFL Bulbs

Measure Name	Core Initiative	PA	2016 Δwatts	2017 Δwatts	2018 Δwatts	Hours
CFL Bulb	Res Lighting	All	44.1	42.0	38.3	1,200
CFL Bulb (EISA Exempt)	Res Lighting	All	43.6	43.6	43.6	1,200
CFL Bulb (Hard to Reach)	Res Lighting	All	44.1	42.0	38.3	1,200
CFL Bulb (School Fundraiser)	Res Lighting	All	44.1	42.0	38.3	1,058
CFL Bulb	HES, RNC	All	44.1	42.0	38.3	986
CFL Bulb	LI Retrofit 1-4	All	44.1	42.0	38.3	986

Savings for Residential CFLs

Measure Name	Core Initiative	PA	2016 ΔkW	2017 ΔkW	2018 ΔkW	2016 ΔkWh	2017 ΔkWh	2018 ΔkWh
CFL Bulb	Res Lighting	All	0.04	0.04	0.04	53.0	50.4	46.0
CFL Bulb (EISA Exempt)	Res Lighting	All	0.04	0.04	0.04	52.4	52.4	52.4
CFL Bulb (Hard to Reach)	Res Lighting	All	0.04	0.04	0.04	53.0	50.4	46.0
CFL Bulb (School Fundraiser)	Res Lighting	All	0.04	0.04	0.04	53.0	50.4	46.0
CFL Bulb	HES, RNC, LI Retrofit 1-4	All	0.04	0.04	0.04	43.4	41.3	37.8
CFL Bulb	MF Retrofit	Eversource	0.04	0.04	0.04	43.4	41.3	37.8
CFL Bulb	LI MF Retrofit	Eversource, CLC	0.04	0.04	0.04	40.8	38.3	35.3

Baseline Efficiency

The baseline efficiency case is a combination of an incandescent bulb and halogen bulb.

High Efficiency

The high efficiency case is an ENERGY STAR® rated CFL bulb.

Hours

Average annual operating hours for efficient bulbs in the Res Lighting program are 1,200 hours/year ((93%*2.9 hours/day + 7% *8.46 hours/day)* 365 days/year). [250, 251,252] Average annual operating hours for all bulbs in the HES, RNC, LI Retrofit 1-4, MF Retrofit and LI MF Retrofit programs are 985.5 hours/year (2.7 hours/day * 365 days/year). [253,]

Measure Life

The measure life for bulbs with an EISA exempt baseline is 7 years.[254] For Residential Lighting the adjusted measure life is 4 years for screw-in bulbs in 2016 – 2018 and for all other initiatives the adjusted measure life is 5 years in 2016 and 4 years in 2017-2018.[255]

Secondary Energy Impacts

There is a heat loss of 2,237 Btu/kWh counted for bulbs sold upstream.[256]

---

[250] NMR Group Inc. (2014). *Northeast Residential Lighting Hours of Use Study.* The study recommended the use of the regional lighting hours of use numbers for both the efficient and all bulb lighting values.

Lighting – CFL Fixtures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of ENERGY STAR® compact fluorescent (CFL) indoor or outdoor fixtures. Compact fluorescent fixtures offer comparable luminosity to incandescent or halogen fixtures at significantly less wattage and significantly longer lifetimes.
Primary Energy Impact: Electric
Secondary Energy Impact: Natural Gas (Residential Heat)
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Lost Opportunity, Retrofit
End Use: Lighting
Measure Type: Interior
Core Initiative: Electric – Residential Lighting

Algorithms for Calculating Primary Energy Impact

For Residential Lighting unit savings are deemed based on the following algorithms, which use averaged inputs.

$$\Delta kW = Bulbs \times Save_{kW}$$
$$\Delta kWh = \Delta kW \times hours$$

Where:

Bulbs = Average # of bulbs per indoor unit:1.49[263]
$Save_{kw}$ = Average kW savings per bulb : See Lighting – CFL Bulbs
Hours = Annual hours of use : 1,200 for Res Lighting and 985.5 for RNC, LI RNC

Savings for CFL Fixtures

Measure Name	Core Initiative	PA	2016 ΔkW	2017 ΔkW	2018 ΔkW	2016 ΔkWh	2017 ΔkWh	2018 ΔkWh
Fixture	Res Lighting	All	0.07	0.06	0.06	78.9	75.1	68.6

Baseline Efficiency

The baseline efficiency case is an incandescent or halogen, screw-based fixture with an incandescent or halogen lamp.

[263] NMR Group, Inc. (2013). *Results of the Massachusetts Onsite Lighting Inventory.* Prepared for the Massachusetts PAs.

High Efficiency

The high efficiency case is an ENERGY STAR® qualified compact fluorescent light fixture wired for exclusive use with pin-based CFLs.

Hours

Average annual operating hours for efficient fixtures in the Residential Lighting program are 1,200 hours/year ((93%*2.9 hours/day + 7% *8.46 hours/day)* 365 days/year). [264, 265,266]

Measure Life

The adjusted measure life is 4 years for Residential Lighting for 2016 – 2018.[267]

Secondary Energy Impact

There is a heat loss of 2,237 Btu/kWh counted for fixtures sold upstream. [268].

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Lighting – LED Bulbs

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of Light-Emitting Diode (LED) screw-in bulbs. LEDs offer comparable luminosity to incandescent and halogen bulbs at significantly less wattage and significantly longer lamp lifetimes.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Lost Opportunity
End Use: Lighting
Measure Type: Interior
Core Initiative: Residential Lighting, Electric - Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Electric - Low-Income Multi-Family Retrofit, Electric – Residential New Construction

Algorithms for Calculating Primary Energy Impact

Unit savings are based on the following algorithms which use averaged inputs:

$$\Delta kW = \Delta watts \ / 1000$$
$$\Delta kWh = \Delta kW * hours$$

Where:
ΔkW = Average kW reduction[271,272]
hours = Hours of use

[271] NMR Group (2015). *Baseline Sensitivity Analysis Spreadsheet, 2016-2018 Plan Version.* Prepared for the Massachusetts PAs.
[272] The Cadmus Group, Inc. (2015). *Massachusetts Low-Income Multifamily Initiative Impact Evaluation*. Prepared for the Electric and Gas Program Administrators of MA.

Factors for Calculating Savings for Residential LED Bulbs

Measure Name	Core Initiative	PA	2016 Δwatts	2017 Δwatts	2018 Δwatts	Hours

LED Bulb	RNC	All	0.03	0.03	0.03	33.0	30.6	28.0

Baseline Efficiency

The baseline efficiency case for the Res Lighting and RNC initiatives is a combination of an incandescent bulb, halogen bulb, and a compact fluorescent bulb. The baseline efficiency case for direct install retrofit initiatives is a combination of an incandescent bulb and halogen bulb.

High Efficiency

The high efficiency case is an ENERGY STAR® rated LED bulb.

Hours

Average annual operating hours for efficient bulbs in the Res Lighting program are 1,200 hours/year ((93%*2.9 hours/day + 7% *8.46 hours/day)* 365 days/year).[273, 274,275] Average annual operating hours for all bulbs in the HES, RNC, LI RNC, LI Retrofit 1-4, MF Retrofit and LI MF Retrofit programs are 985.5 hours/year (2.7 hours/day * 365 days/year).[276]

Measure Life

The measure life for LED EISA Exempt Baseline and Reflectors is 17 years.[277] In the Res Lighting program the adjusted measure life for LED bulbs is 8 years. In the HES, RNC, LI RNC, LI Retrofit 1-4, MF Retrofit and LI MF Retrofit programs the adjusted measure life is 9 years.[278]

Secondary Energy Impacts

There is a heat loss of 2,237 Btu/kWh counted for bulbs sold upstream.[279]

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Lighting – LED Fixtures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of Light-Emitting Diode (LED) fixtures. LEDs offer comparable luminosity to incandescent or halogen bulbs at significantly less wattage and significantly longer lamp lifetimes.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Lost Opportunity
End Use: Lighting
Measure Type: Interior
Core Initiative: Residential Lighting, Electric – Low-Income Single Family Retrofit, Electric - Low-Income Multi-Family Retrofit, Electric - Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

For LI Retrofit 1-4 unit savings are deemed based on study results[286].

Savings for Single Family Low-Income Fixtures

Measure Name	Core Initiative	ΔkWh	ΔkW[287]
Indoor Fixture	LI Retrofit 1-4	140	0.14

For Residential Lighting MF Retrofit and LI MF Retrofit unit savings are based on the following algorithms which use averaged inputs.

$$\Delta kW = Bulbs \times Save_{kW}$$
$$\Delta kWh = \Delta kW \times hours$$

Where:

Bulbs	=	Average # of bulbs per unit for indoor is 1.49 and for outdoor it is 2.0[288]
$Save_{kw}$	=	Average kW savings per bulb : See Lighting – LED Bulbs[289]
Hours	=	Annual hours of use : 1,200 for Res Lighting and 985.5 for MF Retrofit and LI MF Retrofit

Savings for Residential LED Fixtures

[286] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[287] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.
[288] NMR Group, Inc. (2013). *Results of the Massachusetts Onsite Lighting Inventory.* Prepared for the Massachusetts PAs.
[289] NMR Group (2015). *Baseline Sensitivity Analysis Spreadsheet, 2016-2018 Plan Version.* Prepared for the Massachusetts PAs.

Measure Name	Core Initiative	2016 ΔkW	2017 ΔkW	2018 ΔkW	2016 ΔkWh	2017 ΔkWh	2018 ΔkWh
LED Fixture	Res Lighting	0.05	0.05	0.04	59.9	55.5	50.8
In Unit Indoor LED Fixture	MF Retrofit	0.07	0.08	0.06	70.9	68.0	64.0
In Unit Outdoor LED Fixture	MF Retrofit	0.10	0.09	0.09	95.0	91.3	86.5
In Unit Indoor LED Fixture	LI MF Retrofit	0.07	0.07	0.06	70.9	68.0	64.0
In Unit Outdoor LED Fixture	LI MF Retrofit	0.10	0.09	0.09	95.0	91.3	86.5

Baseline Efficiency

The baseline efficiency case is a combination of an incandescent bulb, halogen bulb, and compact florescent bulb for Residential Lighting. The baseline efficiency case for LI MF Retrofit is an incandescent bulb, or a halogen bulb.

High Efficiency

The high efficiency case is an LED fixture.

Hours

Average annual operating hours for efficient bulbs in the Res Lighting program are 1,200 hours/year ((93%*2.9 hours/day + 7% *8.46 hours/day)* 365 days/year).[290, 291,292] The average annual operating hours for efficient bulbs in MF Retrofit and LI MF Retrofit is 985.5 (2.7 hours/day *365 days/year).[293]

Measure Life

The adjusted measure lives for LED Fixtures are[294]:

Measure Name	Core Initiative	2016	2017	2018
LED Fixture	Res Lighting	8	8	8
Indoor Fixture	LI Retrofit 1-4	9	9	9
In Unit Indoor LED Fixture	MF Retrofit	9	9	9
In Unit Outdoor LED Fixture	MF Retrofit	9	9	9
In Unit Indoor LED Fixture	LI MF Retrofit	9	9	9
In Unit Outdoor LED Fixture	LI MF Retrofit	9	9	9

Secondary-Energy Impacts

There is a heat loss of 2,237 Btu/kWh counted for bulbs and fixtures sold upstream.[295]

[290] NMR Group Inc. (2014). *Northeast Residential Lighting Hours of Use Study.* The study recommended the use of the regional lighting hours of use numbers for both the efficient and all bulb lighting values.

Lighting – Bulbs

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Removal of existing inefficient bulbs with the installation of new efficient bulbs
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Retrofit
End Use: Lighting
Measure Type: Interior, Exterior
Core Initiative: Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = [(QTY_{PRE} \times Watts_{PRE} \times Hours_{PRE}) - (QTY_{EE} \times Watts_{EE} \times Hours_{EE})] / 1000 \times 52$$
$$\Delta kW = \Delta kWh \times kW / kWh$$

Where:
QTY_{PRE} = Quantity of pre-retrofit fixtures/bulbs
QTY_{EE} = Quantity of efficient fixtures/bulbs installed
$Watts_{PRE}$ = Rated watts of pre-retrofit fixtures/bulbs
$Watts_{EE}$ = Rated watts of efficient fixtures/bulbs installed
$Hours_{PRE}$ = Weekly hours of operation for pre-retrofit case lighting fixtures/bulbs
$Hours_{EE}$ = Weekly hours of operation for efficient lighting fixtures/bulbs
52 = Weeks per year
kW/kWh = Average kW reduction per kWh reduction: 0.00030 kW/kWh[299]

Baseline Efficiency

The baseline efficiency case is the existing bulbs.

High Efficiency

The high efficiency case is the new bulbs.

Measure Life

The estimated expected useful lives are as shown below[300].

---

[299] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators. Loadshape: Res Multi Family Electric Lighting - Indoor (LIGHTING) Normal

Measure Name	2016 EUL	2017 EUL	2018 EUL
CFL Bulb	5	4	4
LED Bulb	9	9	9

Hours

Operating hours are estimated by the vendor for each facility. Typical assumptions are 24 hours/day for common area lighting, 12 hours/day for exterior lighting, and 2.7 hours/day for in-unit lighting, but may be adjusted based on type of housing. Study-determined hours of use by room type may also be applied.[301] Estimates are verified with facility maintenance staff when possible.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
CFL Bulb	MF Retrofit	National Grid, CLC, Unitil	0.97	0.60	0.60	0.60	0.17	1.00

Lighting - Fixtures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Removal of existing inefficient fixtures with the installation of new efficient fixtures
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Retrofit
End Use: Lighting
Measure Type: Interior, Exterior
Core Initiative: Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are calculated using the following algorithms and assumptions:

$$\Delta kWh = [(QTY_{PRE} \times Watts_{PRE} \times Hours_{PRE}) - (QTY_{EE} \times Watts_{EE} \times Hours_{EE})]/1000 \times 52$$
$$\Delta kW = \Delta kWh \times kW / kWh$$

Where:

QTY_{PRE}	=	Quantity of pre-retrofit fixtures/bulbs
QTY_{EE}	=	Quantity of efficient fixtures/bulbs installed
$Watts_{PRE}$	=	Rated watts of pre-retrofit fixtures/bulbs
$Watts_{EE}$	=	Rated watts of efficient fixtures/bulbs installed
$Hours_{PRE}$	=	Weekly hours of operation for pre-retrofit case lighting fixtures/bulbs
$Hours_{EE}$	=	Weekly hours of operation for efficient lighting fixtures/bulbs
52	=	Weeks per year
kW/kWh	=	Average kW reduction per kWh reduction: 0.00030 kW/kWh[305]

Baseline Efficiency

The baseline efficiency case is the existing fixture.

High Efficiency

The high efficiency case is the new fixtures.

[305] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators. Loadshape: Res Multi Family Electric Lighting - Indoor (LIGHTING) Normal

Measure Life

The estimated expected useful lives are as shown below[306].

Measure Name	2016 EUL	2017 EUL	2018 EUL
In Unit Indoor LED Fixture	9	9	9
In Unit Outdoor LED Fixture	9	9	9
Common Area Int LED Fixture	4	4	4
Common Area Int Linear LED Fixture	9	9	9
Common Area Ext LED Fixture	11	11	11

Hours

Operating hours are estimated by the vendor for each facility. Typical assumptions are 24 hours/day for common area lighting, 12 hours/day for exterior lighting, and 2.7 hours/day for in-unit lighting, but may be adjusted based on type of housing. Study-determined hours of use by room type may also be applied.[307] Estimates are verified with facility maintenance staff when possible.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Lighting - Occupancy Sensors

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of occupancy sensors for lighting fixtures. This measure involves installing an occupancy sensor that controls lighting fixtures and limits their use when the space is unoccupied
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Lighting
Measure Type: Controls
Program: Electric - Multi-Family Retrofit, Electric - Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are based on the following algorithms which use averaged inputs[312]:

$$\Delta kWh = \frac{(Watts_{controlled}) \times Hrs \ \times svg}{1{,}000}$$

Where:

Watts controlled	=	Connected load wattage controlled by Occupancy Sensor
Hours	=	Assumed run time of fixture (before the installation of occupancy sensors (Auditor Input)
svg	=	Percentage of annual lighting energy saved by occupancy sensor is 30% [313]

Baseline Efficiency

The baseline condition for this measure is a lighting fixture that is not controlled by an occupancy sensor.

High Efficiency

The high efficiency case is a lighting fixture that operates with connected occupancy sensors.

Hours

Deemed values for hours may be used if auditor does not collect information.

[312] The Cadmus Group, Inc. (2012). *Massachusetts Multifamily Program Impact Analysis*. Prepared for the Electric and Gas Program Administrators of Massachusetts.
[313] Ibid.

Zone	Usage Category	Hours/Day (Calc.)[314]
Common Area (Exterior)	Exterior	10.3
Common Area (Interior)	Extended Hours & 24/7	24.0
Common Area (Interior)	Low Usage	3.4
Common Area (Interior)	Medium Usage	12.5
Common Area (Interior)	Non-Area Specific	16.2
Dwelling Unit	Unit	2.7

Measure Life

The measure life is 10 years.[315]

Secondary-Energy Impacts

There are no secondary energy impacts counted for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Common Area Occupancy Sensors	MF Retrofit	All	1.00	0.60	0.60	0.60	0.00	0.00
Common Area Occupancy Sensors	LI MF Retrofit	All	1.00	1.00	1.00	1.00	0.00	0.00

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are set to 100% since this program has not been evaluated.

Coincidence Factors
Coincidence factors are set to zero since demand savings typically occur during off- peak periods.

Motors/Drives – Pool Pump

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a 2-speed or variable speed drive pool pump. Operating a pool pump for a longer period of time at a lower wattage can move the same amount of water using significantly less energy.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Variable Speed Drive
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on averaged results from the ENERGY STAR pool pump calculator.[316] The calculator was run for 6 scenarios; a two-speed replacement pump and a variable speed replacement pump, for 3 baseline sizes ranging from 1HP to 2HP.

Demand savings are deemed based on the following algorithms, which use averaged inputs aligning with the scenarios run for the calculator.

$$MD = \frac{FR*60}{EF} \times \frac{RT}{24} \times \frac{1}{1000}$$

$MD_{Efficient} = MD_{High\ Flow} + MD_{Low\ Flow}$
Demand Savings = $MD_{Efficient} - MD_{Baseline}$

Where:

MD	=	Maximum Demand of Pump under given operating conditions
FR	=	Maximum Flow Rate of Pump (gallons/minute); From EnergyStar calculator
60	=	Minutes per hour
RT	=	Pump run time (hours/day)
24	=	Hours per day
EF	=	Energy Factor (gallons/Watt-hour); From EnergyStar calculator

For each pump, the run time was set to achieve 1.5 turnovers per day, with 2 hours at high speed for cleaning.
For 1horsepower pumps, pool size was assumed to be 20,000 gallons

[316] http://www.energystar.gov/sites/default/files/asset/document/Pool%20Pump%20Calculator.xlsx

For 1.5 horsepower pumps, pool size was assumed to be 22,500 gallons
For 2 horsepower pumps, pool size was assumed to be 23,000 gallons

Savings for Pool Pumps

Measure Name	Core Initiative	PA Type	ΔkWh	ΔkW
Pool Pump (Two Speed)	Res Products	Elec	842	0.38
Pool Pump (Variable Speed)	Res Products	Elec	1,062	0.50

Baseline Efficiency

The baseline efficiency case is a single speed 1.5 horsepower pump that pumps 64 gallons per minute and runs 8.5 hours per day for 91 days a year. It has an EF = 2.1 and cycles 32,640 gallons per day.

High Efficiency

The high efficiency case is a 2-speed or variable speed pump.

For the two-speed pump the high efficiency case is a 2.0 HP pump rated at 66 gpm high speed (oversized motor compared to the base case). It has a 2.0 EF at high speed, a 5.2 EF at low speed (50% flow) and runs 2 hr/day at high speed for filter & cleaning and 12.5 hr/day for filtering alone to deliver the equivalent total gallons of cycling per day.

For the variable speed pump the high efficiency case is a variable speed pump rated at 50 gpm high speed. It has a 4.0 EF at high speed, a 8.8EF at low speed and runs 2 hr/day at high speed for filter & cleaning and 18 hr/day for filtering alone

Hours

Hours of use are dependent on the efficiency of the pump and the size of the pool, as described above. Pumps are assumed to be in use for 91 days per year.

Measure Life

The measure life is 10 years.[317]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

[317] Davis Energy Group (2008). *Proposal Information Template for Residential Pool Pump Measure Revisions*. Prepared for Pacific Gas and Electric Company.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}

Plug Load – Room Air Cleaner

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Rebates provided for the purchase of an ENERGY STAR® qualified room air cleaner. ENERGY STAR® air cleaners are 40% more energy-efficient than standard models.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Room Air Cleaners
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on averaged inputs.[319]

Measure Name	Core Initiative	ΔkWh	ΔkW[320]
Room Air Cleaner	Res Products	391	0.08

Baseline Efficiency

The baseline efficiency case is a conventional unit with clean air delivery rate (CADR) of 51-100.

High Efficiency

The high efficiency case is an ENERGY STAR® qualified air cleaner with a CADR of 51-100.

Hours

The savings are based on 16 operating hours per day, 365 days per year.[321]

Measure Life

The measure life is 9 years.[322]

Plug Load – Smart Strips

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Switches off plug load using current sensors and switching devices which turn off plug load when electrical current drops below threshold low levels. Smart Strips can be used on electrical home appliances or in the workplace.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential, Low-Income
Market: Lost Opportunity, Retrofit
End Use: Process
Measure Type: Smart Strips
Core Initiative: Electric - Residential Consumer Products, Electric - Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Electric - Multi-Family Retrofit, Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[324]

Savings for Smart Strips

Measure Name	Core Initiative	ΔkWh	ΔkW[325]
Smart Strip	Res Products, HES, LI Retrofit 1-4	75.1	0.02
Smart Strip	MF Retrofit, LI MF Retrofit	75.1	0.01

Baseline Efficiency

The baseline efficiency case is no power strip and leaving peripherals on or using a power surge protector.

High Efficiency

The high efficiency case is a Smart Strip Energy Efficient Power Bar

Hours

Since the power strip is assumed to be plugged in all year, the savings are based on 8,760 operational hours per year.

[324] NEEP (2012). *Advanced Power Strips Deemed Savings Methodology.*
[325] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Measure Life

The measure life is 5 years[326]

Secondary-Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Smart Strip	Res Products	All	1.00	1.00	1.00	1.00	0.73	1. 00

Plug Load – Dehumidifier

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of an Energy Star dehumidifier.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Process
Measure Type: Dehumidifiers
Core Initiative: Electric - Residential Consumer Products

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = Capacity \times \frac{0.473}{24} \times \left(\frac{1}{Eff_{BASE}} - \frac{1}{Eff_{EE}} \right) \times Hours$$

$$\Delta kW = \Delta kWh_{EE} / Hours$$

Where:

Capacity = Average capacity of dehumidifier in Pints/24 Hours: 35 Pints/Day[332]
Eff_{BASE} = Average efficiency of conventional model in Liters/kWh
Eff_{EE} = Average efficiency of ENERGY STAR® model in Liters/kWh
Hours = Dehumidifier annual operating hours
0.473 = Conversion factor: 0.473 Liters/Pint
24 = Conversion factor: 24 Hours/Day
CF = Summer Peak Coincidence Factor; 0.37[333]

Savings for Dehumidifiers

Measure Name	Core Initiative	ΔkWh	ΔkW
Dehumidifier	Res Products	239	0.04

Baseline Efficiency

The baseline efficiency is a unit meeting the current federal standard:[334]

---

332 35 pints per day was the average capacity for units turned in at the Cape Light Compact's May 2010 event.
333 Assumes usage is evenly distributed day vs. night, weekend vs. weekday and is used for 8 months per year (5760 possible hours). Coincidence during summer peak is therefore 2160/5760 = 37.5%
334 http://www.gpo.gov/fdsys/pkg/BILLS-110hr6enr/pdf/BILLS-110hr6enr.pdf

Unit Size	EF
30 Pint/Day	1.35
50 Pint/Day	1.60
70 Pint/Day	1.70

High Efficiency

The high efficiency case is an ENERGY STAR® unit with an efficiency of 1.85 L/kWh[335].

Hours

Average annual operating hours are 2,160 hours.[336]

Measure Life

The measure life is 12 years.[337]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Dehumidifier	Res Products	All	1.00	1.00	1.00	1.00	0.85	1.00

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on Massachusetts Common Assumptions.

[335] Energy Star Dehumidifiers Product List, posted to the Energy Star website on August 2, 2012.

Plug Load – Dehumidifier Recycling

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Early retirement of existing dehumidifiers
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low-Income
Market: Retrofit
End Use: Process
Measure Type: Dehumidifiers
Core Initiative: Electric - Residential Consumer Products, Electric - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh_{RETIRE} = Capacity \times \frac{0.473}{24} \times \left(\frac{1}{Eff_{RETIRE}} - \frac{1}{Eff_{BASE}} \right) \times Hours$$

$$\Delta kW_{RETIRE} = \Delta kWh_{RETIRE} / Hours$$

Where:

Unit	=	Replacement of existing dehumidifier with new ENERGY STAR® dehumidifier
Capacity	=	Average capacity of dehumidifier in Pints/24 Hours: 35 Pints/Day[338]
Eff_{BASE}	=	Average efficiency of new conventional model in Liters/kWh
Eff_{RETIRE}	=	Average efficiency of existing model in Liters/kWh
Hours	=	Dehumidifier annual operating hours
0.473	=	Conversion factor: 0.473 Liters/Pint
24	=	Conversion factor: 24 Hours/Day

Savings for Dehumidifiers
The total savings are the result of a weighted average for the algorithm above for three sizes, 30 pint, 50 pint, and 70 pint.

Measure Name	ΔkWh	ΔkW
Dehumidifier Recycling (EE)	239	0.04
Dehumidifier Recycling (Retire)	152	0.03

The baseline efficiency case for a retired dehumidifier ($Eff_{RETIRED}$) is the pre-2012 federal standards:[339]

Unit Size	Pre-2012 EF

[338] 35 pints per day was the average turn in at the Cape Light Compact's May 2010 event. This event retired 125 units.
[339] United States Congress. http://energy.gov/sites/prod/files/2013/10/f3/epact_2005.pdf

30 Pint/Day	1.20
50 Pint/Day	1.30
70 Pint/Day	1.50

High Efficiency

The high efficiency case assumes replacement with a unit meeting the current minimum federal standard[340].

Unit Size	EF
30 Pint/Day	1.35
50 Pint/Day	1.60
70 Pint/Day	1.70

Hours

Average annual operating hours are 2,106 hours.[341]

Measure Life

The measure life is 5 years.[342]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Dehumidifier Recycling	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	0.85	0. 00

In-Service Rates
In-service rates are set to 100% based on the assumption that all purchased units are installed.

Realization Rates
Realization rates are based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are based on Massachusetts Common Assumptions.

[340] Department of Energy. https://www1.eere.energy.gov/buildings/appliance_standards/product.aspx/productid/55#standards
[341] The Cadmus Group, Inc. http://aceee.org/files/proceedings/2012/data/papers/0193-000291.pdf
[342] On average, turn-in units at the Cape Light Compact's May 2010 event were 7 years old. The full measure life of 12 years minus the average age of the retired equipment of 7 years equals a remaining life of 5 years.

Water Heating – Pipe Wrap

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of DHW pipe wraps
Energy Impact: Electric, Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Retrofit
End Use: Hot Water
Measure Type: Insulation
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Electric – Multi-Family Retrofit, Gas – Multi-Family Retrofit, Electric – Low Income Multi-Family Retrofit, Gas – Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[343,344,345] where unit is a household with pipe wrap installed on hot water pipes.

Savings for Pipe Wrap (Water Heating)

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[346]	ΔMMBtu
Pipe Wrap (Water Heating), Electric	HES	Electric	64	0.01	
Pipe Wrap (Water Heating), Oil	HES	Oil			0.4
Pipe Wrap (Water Heating), Other	HES	Propane			0.3
Pipe Wrap (Water Heating), Gas; Pipe Wrap (Water Heating)	HES	Gas			0.3
Pipe Wrap (Water Heating), Electric	LI Retrofit 1-4	Electric	41	0.01	
Pipe Wrap (Water Heating), Oil	LI Retrofit 1-4	Oil			0.4
Pipe Wrap (Water Heating), Other	LI Retrofit 1-4	Propane			0.4
Pipe Wrap (Water Heating)	LI Retrofit 1-4	Gas			0.4
Pipe Wrap (Water Heating), Electric	MF Retrofit	Electric	129	0.02	
Pipe Wrap (Water Heating), Oil	MF Retrofit	Oil			1.14
Pipe Wrap (Water Heating), Other	MF Retrofit	Propane			1.14

345 The Cadmus Group (2012). *Massachusetts Multifamily Program Impact Analysis July 2012 – Revised May 2013.* Prepared for Massachusetts Program Administrators.
346 Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[346]	ΔMMBtu
Pipe Wrap (Water Heating)	MF Retrofit	Gas			1.14
Pipe Wrap (Water Heating), Electric	LI MF Retrofit	Electric	129	0.02	
Pipe Wrap (Water Heating), Oil	LI MF Retrofit	Oil			1.14
Pipe Wrap (Water Heating), Other	LI MF Retrofit	Propane			1.14
Pipe Wrap (Water Heating)	LI MF Retrofit	Gas			1.14

Baseline Efficiency

The baseline efficiency case is the existing hot water equipment.

High Efficiency

The high efficiency case includes pipe wrap.

Hours

Not applicable.

Measure Life

The measure life is 15 years.[347]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

[347] GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measures*. Prepared for The New England State Program Working Group; Page 1-3, Table 1.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA Type	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Pipe Wrap (Water Heating)	HES	Electric	All	1.00	1.00	1.00	1.00	1.00	0.94
Pipe Wrap (Water Heating)	LI Retrofit 1-4	Electric	All	1.00	1.00	1.00	1.00	1.00	0.94
Pipe Wrap (Water Heating)	MF Retrofit	Electric	All	1.00	0.60	0.60	0.60	0.58	1.00

Pipe Wrap (Water Heating)	LI MF Retrofit	Gas	National Grid	1.00	0.75	n/a	n/a	n/a	n/a
Pipe Wrap (Water Heating)	LI MF Retrofit	Gas	Columbia	1.00	0.96	n/a	n/a	n/a	n/a
Pipe Wrap (Water Heating)	LI MF Retrofit	Gas	Unitil	1.00	0.96	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
- For HES, LI Retrofit 1-4 the realization rates are set to 100% since deemed savings are based on evaluation results.
- For LI MF Retrofit the realization rates are based on evaluation results. [348]
- For MF Retrofit the realization rate is based on draft evaluation results.[349]

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[350]

[348] The Cadmus Group (2015). *Massachusetts Low-Income Multifamily Initiative Impact Analysis.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

Water Heating – Showerheads

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: An existing showerhead with a high flow rate is replaced with a new low flow showerhead.
Primary Energy Impact: Electric, Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts, Residential Water
Sector: Residential, Low Income
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Electric – Multi-Family Retrofit, Gas – Multi-Family Retrofit, Electric – Low Income Multi-Family Retrofit, Gas – Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results. [351,352,353,354]

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[355]	ΔMMBtu
Low-Flow Showerhead, Electric	HES	Electric	237	0.03	
Low-Flow Showerhead, Oil	HES	Oil			1.3
Low-Flow Showerhead, Other	HES	Propane			1.2
Low-Flow Showerhead, Gas; Low-Flow Showerhead	HES	Gas			1.2
Low-Flow Showerhead	LI Retrofit 1-4	Electric	188	0.03	
Low-Flow Showerhead, Oil	LI Retrofit 1-4	Oil			1.1
Low-Flow Showerhead, Other	LI Retrofit 1-4	Propane			0.9
Low-Flow Showerhead, Gas	LI Retrofit 1-4	Gas			0.9
Low-Flow Showerhead, Electric	MF Retrofit	Electric	129	0.02	
Low-Flow Showerhead, Other	MF Retrofit	Oil			1.14

351 The Cadmus Group, Inc. (2012). *Home Energy Services Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
352 The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
353 The Cadmus Group (2012). *Massachusetts Multifamily Program Impact Analysis July 2012 – Revised May 2013.* Prepared for Massachusetts Program Administrators.
354 The Cadmus Group, Inc. (2015). *Massachusetts Low-Income Multifamily Initiative Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
355 Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[355]	ΔMMBtu
Low-Flow Showerhead, Other	MF Retrofit	Propane			1.14
Low-Flow Showerhead, Gas	MF Retrofit	Gas			1.14
Low-Flow Showerhead, Electric	LI MF Retrofit	Electric	217	0.04	
Low-Flow Showerhead, Oil	LI MF Retrofit	Oil			1.07
Low-Flow Showerhead, Gas	LI MF Retrofit	Gas			1.07

Baseline Efficiency

The baseline efficiency case is the existing showerhead with a baseline flow rate of 2.5 GPM.

High Efficiency

The high efficiency case is a low flow showerhead having a maximum flow rate between 1.5 and 1.7 GPM.

Hours

Not applicable.

Measure Life

The measure life is 7 years[356]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Residential Water	Residential water savings for low-flow showerheads [357]	2,401 Gallons/Unit
Residential Water	Multifamily water savings for low-flow showerheads [358]	2,165 Gallons/Unit
Residential Water	Low-Income Multifamily water savings for low-flow showerheads [359]	1,759 Gallons/Unit
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Water Heating – Faucet Aerator

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: An existing faucet aerator with a high flow rate is replaced with a new low flow aerator.
Primary Energy Impact: Electric, Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts, Residential Water
Sector: Residential, Low Income
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Home Energy Services, Electric - Low-Income Single Family Retrofit, Gas - Low-Income Single Family Retrofit, Electric – Multi-Family Retrofit, Gas – Multi-Family Retrofit, Electric – Low Income Multi-Family Retrofit, Gas – Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results. [361,362,363,364]

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[365]	ΔMMBtu
Faucet Aerator, Electric	HES	Electric	49	0.01

Water Heating - Showerhead with Thermostatic Valve

Version Date and Revision History

Effective date: 1/1/2016
End date: TBD

Measure Overview

Description: An existing showerhead is replaced with a low-flow showerhead with an integrated thermostatic shut-off valve (TSV).
Primary Energy Impact: Electric, Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts, Residential Water
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: Electric - Residential Consumer Products, Electric - Multi-Family Retrofit, Gas - Multi-Family Retrofit

Notes

Thermostatic shut-off valve technology is known by the trademarked name ShowerStart™.

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on engineering analysis.[370]

Measure Name	Core Initiative	Energy Type	ΔkW[371]	ΔkWh	ΔMMBtu
Low-Flow Showerhead with TSV, Electric	Res Products	Electric	0.06	372	
Low-Flow Showerhead with TSV, Oil	Res Products	Oil			2.09
Low-Flow Showerhead with TSV, Other	Res Products	Propane			1.84
Low-Flow Showerhead with TSV, Gas	Res Products	Gas			1.84
Low-Flow Showerhead with TSV, Electric	MF Retrofit	Electric	0.06	335	
Low-Flow Showerhead with TSV, Oil	MF Retrofit	Oil			1.88
Low-Flow Showerhead with TSV, Other	MF Retrofit	Propane			1.66
Low-Flow Showerhead with TSV	MF Retrofit	Gas			1.66

Baseline Efficiency

The Baseline Efficiency case is an existing standard-flow showerhead (2.5 GPM) with no thermostatic shut-off valve.

370 National Grid (2014). *Review of ShowerStart evolve.*
371 Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

High Efficiency

The high efficiency case is a low-flow showerhead (1.5 GPM) with integrated thermostatically actuated valve.

Hours

Not applicable.

Measure Life

The measure life is 7 years.[372]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Residential Water	Residential water savings for showerhead with integrated TSV	3,022 Gallons/Unit-year[373]
Residential Water	Multifamily water savings for showerhead with integrated TSV	2,723 Gallons/Unit-year[374]
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Program	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Low-Flow Showerhead with TSV	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.94
Low-Flow Showerhead with TSV	MF Retrofit	All	1.00	0.60	1.60	1.60	0.58	1.00

In-Service Rates
All installations have 100% in service rate.

Realization Rates
All PAs use 100% energy realization rate except for MF Retrofit where the realization rate is based on draft evaluation results.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[375]

372 Massachusetts common assumption
373 National Grid (2014). *Review of ShowerStart evolve.*

Water Heating - Thermostatic Valve

Version Date and Revision History

Effective date: 1/1/2016
End date: TBD

Measure Overview

Description: A stand-alone valve that may be used with existing showerhead.
Primary Energy Impact: Electric, Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts, Residential Water
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: Electric - Residential Consumer Products, Electric - Multi-Family Retrofit, Gas - Multi-Family Retrofit

Notes

Thermostatic shut-off valve technology is known by the trademarked name ShowerStart™.

Algorithms for Calculating Primary Energy Impacts

The unit savings are deemed based on engineering analysis. [376]

Measure Name	Core Initiative	Energy Type	ΔkWh	ΔkW[377]	ΔMMBtu
Thermostatic Shut-off Valve, Electric	Res Products	Electric	76	0.01	
Thermostatic Shut-off Valve, Oil	Res Products	Oil			0.43
Thermostatic Shut-off Valve, Other	Res Products	Propane			0.38
Thermostatic Shut-off Valve, Gas	Res Products	Gas			0.38
Thermostatic Shut-off Valve, Electric	MF Retrofit	Electric	69	0.01	
Thermostatic Shut-off Valve, Oil	MF Retrofit	Oil			0.39
Thermostatic Shut-off Valve, Other	MF Retrofit	Propane			0.34
Thermostatic Shut-off Valve	MF Retrofit	Gas			0.34

Baseline Efficiency

The Baseline Efficiency case is an existing standard-flow showerhead (2.5 GPM) with no thermostatic shut-off valve.

[376] National Grid (2014). *Review of ShowerStart evolve.*
[377] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.

High Efficiency

The high efficiency case is a standard-flow showerhead (2.5 GPM) with the addition of the stand-alone thermostatic shut-off valve (the "Ladybug").

Hours

Not applicable.

Measure Life

The measure life is 7 years.[378]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Residential Water	Residential water savings for TSV	621 Gallons/Unit-year[379]
Residential Water	Residential water savings for TSV	558 Gallons/Unit-year[380]
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Program	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Thermostatic Shut-off Valve	Res Products	All	1.00	1.00	1.00	1.00	1.00	0.94
Thermostatic Shut-off Valve	MF Retrofit	All	1.00	0.60	0.60	0.60	0.58	1.00

In-Service Rates
All installations have 100% in service rate.

Realization Rates
All PAs use 100% energy realization rate.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2013). Prepared for Massachusetts Program Administrators.[381]

Water Heating – Waterbed Mattress Replacement

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Replacement of waterbed mattress with a standard mattress.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: Electric - Low-Income Single Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[382]:

Measure Name	Core Initiative	ΔkWh	ΔkW[383]
Waterbed	LI Retrofit 1-4	872	0.19

Baseline Efficiency

The baseline efficiency case is an existing waterbed mattress.

High Efficiency

The high efficiency case is a new standard mattress.

Hours

Not applicable.

Measure Life

The measure life is 10 years.[384]

[382] The Cadmus Group, Inc. (2009). *Impact Evaluation of the 2007 Appliance Management Program and Low Income Weatherization Program.* Prepared for National Grid.
[383] Estimated using demand allocation methodology described in: Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.
[384] See the response to the question “How do I know when I need to buy a new mattress?” at the following link for more details: http://www.serta.com/#/best-mattress-FAQs-mattresses-Serta-Number-1-Best-Selling-Mattress.html (8/19/2010).

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Waterbed	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	0.73	1.00
Waterbed	LI MF Retrofit	All	1.00	1.00	1.00	1.00	0.67	1.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[385]

[385] The Cadmus Group, Inc. (2012). *Demand Impact Model.* Prepared for the Massachusetts Program Administrators.

Water Heating – Indirect Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Indirect water heaters use a storage tank that is heated by the main boiler. The energy stored by the water tank allows the boiler to turn off and on less often, saving considerable energy.
Primary Energy Impact: Oil, Propane, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
Indirect Water Heater, Oil	HES	Oil	6.4[386]
Indirect Water Heater	RHVAC	Gas	8.0[387]
Indirect Water Heater, Other	HES	Propane	8.0[388]

Baseline Efficiency

The baseline efficiency case is the existing water heater.

High Efficiency

The high efficiency case is an indirect water heater attached to an ENERGY STAR® rated forced hot water boiler.

Hours

Not applicable.

[386] The Cadmus Group, Inc. (2012). *Home Energy Services Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.

[388] Ibid.

Measure Life

The measure life is 20 years.[389]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Indirect Water Heater	HES	All	1.00	1.00	n/a	n/a	n/a	n/a
Indirect Water Heater	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. Summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[389] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks.

Water Heating – On Demand/Tankless Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Tankless water heaters circulate water through a heat exchanger to be heated for immediate use, eliminating the standby heat loss associated with a storage tank
Primary Energy Impact: None
Secondary Energy Impact: Propane, Gas
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Electric - Residential Home Energy Services, Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[390].

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
On-Demand Water Heater, Other	HES	Propane	8.3
Tankless Water Heater 0.82	RHVAC	Gas	9.4
Tankless Water Heater 0.94	RHVAC	Gas	9.9

Baseline Efficiency

The baseline efficiency case is a standalone tank water heater with a 0.6 EF. For the early retirement portion, the baseline efficiency is an existing 0.55 EF standalone water heater.

High Efficiency

The high efficiency case is either an On Demand tankless water heater with an energy factor >= 0.82 or an On Demand tankless water heater with an energy factor >= 0.94.

Hours

Not applicable.

Measure Life

The measure life is 19 years for gas equipment[391] and 20 years for propane equipment[392].

[390] The calculation of the adjustment can be found in the 2016-2018 HEHE Savings Workbook.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
On Demand Water Heater, Other	HES	All	1.00	1.00	n/a	n/a	n/a	n/a
Tankless Water Heater 0.82	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a
Tankless Water Heater 0.94	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% energy realization rate. Summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Water Heating – Stand Alone Storage Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Stand-alone storage water heaters are high efficiency water heaters that are not combined with space heating devices.
Primary Energy Impact: Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[393].

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
Stand Alone Water Heater 0.67	RHVAC	Gas	3.6

Baseline Efficiency

The baseline efficiency case is a standalone tank water heater with an energy factor of 0.60. For the early retirement portion. the baseline efficiency is an existing 0.55 EF standalone water heater.

High Efficiency

The high efficiency case is a stand-alone storage water heater with an energy factor >= 0.67.

Hours

Not applicable.

Measure Life

The measure life is 11 years. [394]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Stand Alone Water Heater 0.67	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% energy realization rate. Summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Water Heating – Condensing Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Condensing water heaters recover energy by using either a larger heat exchanger or a second heat exchanger to reduce the flue-gas temperature to the point that water vapor condenses, thus releasing even more energy.
Primary Energy Impact: None
Secondary Energy Impact: Gas
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Retrofit
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Gas - Residential Heating & Cooling Equipment

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results.

Measure Name	Core Initiative	Energy Type	ΔMMBtu/Unit
Condensing Water Heater 0.95	RHVAC	Gas	8.5[395]

Baseline Efficiency

The baseline efficiency case is a standalone tank water heater with an energy factor of 0.60.

High Efficiency

The high efficiency case is a condensing water heater with a TE>= 0.95.

Hours

Not applicable.

Measure Life

The measure life is 15 years. [396]

[395] The Cadmus Group, Inc. (2012) *Memo to HEHE Program Administrators Re: Impacts of Upcoming Federal Standards on HEHE Gas Space and Water Heating Measures*; June 8, 2012.
[396] DOE (2008). *ENERGY STAR® Residential Water Heaters: Final Criteria Analysis*. Prepared for the DOE; Page 10.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Condensing Water Heater 0.95	RHVAC	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% energy realization rate. Summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Water Heating – Heat Pump Water Heater (Electric)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a heat pump water heater (HPWH) instead of an electric resistance water heater.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity, Low-Income
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Electric - Residential Cooling & Heating Equipment, Electric - Low-Income Single Family Retrofit, Electric - Low Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[397]:

Measure Name	ΔkWh	ΔkW[398]
Heat Pump Water Heater <55 gallon, Electric	1,654	0.34

Baseline Efficiency

The baseline efficiency case is a new, standard efficiency electric resistance hot water heater.

High Efficiency

The high efficiency case is a high efficiency heat pump water heater.

Hours

Not applicable.

Measure Life

The measure life is 10 years.[399]

[397] Ibid.
[398] Ibid.
[399] Based on warranty of equipment.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Heat Pump Water Heater <55 gallon, Electric	RHVAC	All	1.00	1.00	1.00	1.00	0.47	1.00
Heat Pump Water Heater <55 gallon, Electric	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	0.47	1.00
Heat Pump Water Heater <55 gallon	LI MF Retrofit	All	1.00	1.00	1.00	1.00	0.47	1.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Coincidence factors are based on evaluation results.[400] Winter coincidence equal to 1 since gross kW savings are equal to winter peak demand savings.

Water Heating – Water Heating Systems

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of high efficiency water heating equipment to replace the existing inefficient water heater.
Primary Energy Impact: Natural Gas (Residential DHW)
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: Gas - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta MMBtu = Units \times \frac{18\ MMBtu}{Unit} \times \left(\frac{1}{EF_{BASE}} - \frac{1}{EF_{EE}} \right)$$

Where:

Unit	=	Total number of dwelling units utilizing the water heater
18 MMBtu/Unit	=	Average annual water heating energy demand per dwelling unit[401]
EF_{BASE}	=	Energy Factor for the baseline water heater
EF_{EE}	=	Energy Factor for the new efficient water heater

Baseline Efficiency

The baseline efficiency case is a stand-alone tank water heater with an energy factor of 0.575.

High Efficiency

The high efficiency case includes the new efficient water heater with an Energy Factor > 0.60.

Hours

Not applicable.

Whole Home – Heating, Cooling, and DHW Measures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: To capture lost opportunities, encourage the construction of energy-efficient homes, and drive the market to one in which new homes are moving towards net-zero energy.
Primary Energy Impact: Electric, Natural Gas, Oil, Propane
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential, Low Income
Market: Lost Opportunity
End Use: Energy Star Homes, Hot Water
Measure Type: Custom
Core Initiative: Electric - Residential New Construction, Gas - Residential New Construction

Algorithms for Calculating Primary Energy Impact

Savings are derived from three components within this initiative: Low-Rise Performance Path, Low-Rise Prescriptive Path, and Multi-Family High-Rise Path.

The Program Administrators currently use vendor calculated energy savings for Low-Rise Performance Path projects. These savings are calculated using a RESNET accredited Rating Software Tool (REM/Rate) where a user inputs a detailed set of technical data about a project, comparing as-built projected energy consumption to that of a Baseline Home. This process is used to calculate electric and fossil fuel energy savings due to heating, cooling, and water heating for all homes, both single family and multifamily buildings (three stories and below).[406]

For homes participating in the program via the Low-Rise Prescriptive Path, deemed savings are applied to each unit completing the requirements of the Program. The deemed savings were derived by ICF International using energy simulation tools to create a sample set of 168 homes that represented every type of home that would typically participate in the initiative, including various building types, sizes, fuel types, HVAC system types and climate locations.[407]

For homes participating in the Multi-Family High-Rise Path, ICF International created 98 customized engineering formulas for energy conservation measures spanning the following: Domestic Hot Water, Envelope, HVAC, Lighting, Refrigeration/Appliances and Motors & Drives.[408]

406 ICF International (2008). *Energy/Demand Savings Calculation and Reporting Methodology for the Massachusetts ENERGY STAR ® Homes Program*. Prepared for Joint Management Committee.
407 ICF International (2012). 2013 Prescriptive Modeling Summary Final
408 ICF International (2012). Multi-Family Savings Methodology

Baseline Efficiency

The User Defined Reference Home was revised for 2012 as a result of the baseline study completed in 2012.[409] [410]

High Efficiency

The high efficiency case is represented by the specific energy characteristics of each "as-built" home completed through the program.

Hours

Not applicable.

Lighting (High Rise)	RNC	All	1.00	1.00	1.00	1.00	0.17	1.00

In-Service Rates
All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates
Realization rates are 100% because energy and demand savings are custom calculated based on project specific detail.

Coincidence Factors
Coincidence factors are custom calculated based on project-specific detail.

Whole Home – Weatherization and Heating and Water Heating Systems

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Weatherization measures installed through the Low Income Multifamily program including insulation, air sealing, heating and water heating systems.
Primary Energy Impact: Electric, Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Envelope
Measure Type: Custom
Core Initiative: Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

The program delivery agency uses vendor calculated energy savings for all allowed measures. These savings values are calculated using vendor proprietary software where the user inputs a set of technical data about the house and the software calculates building heating and cooling loads and other key parameters. The proprietary building model is based on thermal transfer, building gains, and a variable-based heating/cooling degree day/hour climate model. This provides an initial estimate of energy use that may be compared with actual billing data to adjust as needed for existing conditions. Then, specific recommendations for improvements are added and savings are calculated using measure-specific heat transfer algorithms.

Rather than using a fixed degree day approach, the building model estimates both heating degree days and cooling degree hours based on the actual characteristics and location of the house to determine the heating and cooling balance point temperatures. Savings from shell measures use standard U-value, area, and degree day algorithms, (see attached for details). Infiltration savings use site-specific seasonal factors to convert measured leakage to seasonal energy impacts. HVAC savings are estimated based on changes in system and/or distribution efficiency improvements, using ASHRAE 152 and BPI recommendations as their basis. Interactivity between architectural and mechanical measures is always included, to avoid overestimating savings due to incorrectly "adding" individual measure results.

Baseline Efficiency

The baseline efficiency case is the existing conditions of the participating household.

High Efficiency

The high efficiency case includes installed energy efficiency measures that reduce heating energy use.

Hours

Not applicable.

Indirect Water Heater	LI MF Retrofit	Columbia	1.00	0.96	n/a	n/a	n/a	n/a
Stand Alone Water Heater	LI MF Retrofit	Columbia	1.00	0.96	n/a	n/a	n/a	n/a
Tankless Water Heater	LI MF Retrofit	Columbia	1.00	0.96	n/a	n/a	n/a	n/a

<u>In-Service Rates</u>
All installations have 100% in service rate since all PA programs include verification of equipment installations.

<u>Realization Rates</u>
Realization rates are based on evaluation results[419].

<u>Coincidence Factors</u>
There are no electric savings for these measures.

[419] The Cadmus Group (2015). *Massachusetts Low-Income Multifamily Initiative Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts

Whole Home – Basic Educational Measures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of basic educational measures during an audit to help customers become more aware of energy efficiency.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Low Income
Market: Retrofit
End Use: Behavior
Measure Type: Audit
Core Initiative: Electric - Low-Income Single Family Retrofit; Electric - Low-Income Multi-Family Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[420].

Measure Name	Core Initiative	PA	ΔkWh	ΔkW[421]
Participants/TLC Kit	LI Retrofit 1-4	National Grid, Eversource, Unitil	69	0.01
Participants/TLC Kit	LI Retrofit 1-4	CLC	126	0.03
Participants/TLC Kit	LI MF Retrofit	Eversource	69	0.01
Participant	LI MF Retrofit	CLC	126	0.03

Baseline Efficiency

The baseline efficiency case assumes no measures installed.

High Efficiency

The high efficiency case includes basic educational measures such as LED nightlights, refrigerator thermostats, hot water thermostats, refrigerator coil brush, wall plate stoppers (and low flow showerheads and aerators for CLC).

Hours

Not applicable.

[420] The Cadmus Group, Inc. (2012). *Low Income Single Family Impact Evaluation.* Prepared for the Electric and Gas Program Administrators of Massachusetts.
[421] The Cadmus Group, Inc. (2012). *Demand Impact Model.* Prepared for the Massachusetts Program Administrators.

Measure Life

The measure life is 5 years.[422]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Participants/TLC Kit	LI Retrofit 1-4	All	1.00	1.00	1.00	1.00	0.73	1.00
Participant	LI MF Retrofit	All	1.00	1.00	1.00	1.00	0.77	1.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Realization rates are set to 100% since deemed savings are based on evaluation results.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[423]

[422] Massachusetts Common Assumption.

Whole Home – Education Kits

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Through Cape Light Compacts Energy Education Outreach Program, we are reaching out to each town through existing school partnerships and will now include Energy Education kits for students to bring home. Each kit will includes 3 LED light bulbs, and a 2 faucet aerators for students to install as well as other non-savings measures such as hot water temperature and refrigerator/freezer thermometer cards to assist students in learning more about energy efficiency.
Primary Energy Impact: Electric, Gas, Oil, Propane
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Residential
Market: Lost Opportunity
End Use: Lighting, Hot Water
Measure Type: Education
Core Initiative: Electric – Residential Behavior/Feedback

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed.

Measure Name	PA	ΔkWh 2016	ΔkWh 2017	ΔkWh 2018	ΔkW 2016	ΔkW 2017	ΔkW 2018	ΔMMBtu
Energy Education kit, Electric Hot Water	CLC	242.9	236.9	228.8	0.05	0.05	0.05	
Energy Education kit, Gas Hot Water	CLC	144.9	138.9	130.8	0.03	0.03	0.03	0.3
Energy Education kit, Oil Hot Water	CLC	144.9	138.9	130.8	0.03	0.03	0.03	0.2
Energy Education kit, Propane Hot Water	CLC	144.9	138.9	130.8	0.03	0.03	0.03	0.2

Baseline Efficiency

The baseline efficiency case assumes no measures installed.

High Efficiency

The high efficiency case includes the savings measures in the Educational Kit: 3 LED Bulbs and 2 low flow faucet aerators. See: Lighting – LED Bulbs, Water Heating – Faucet Aerator.

Hours

Not applicable.

Measure Life

The measure life is 10 years[424].

Secondary Energy Impacts

There are no secondary impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Residential Water	Residential water savings from kit	664 gallons/kit
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts
One-Time Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Energy Education, Electric	Behavior/ Feedback	CLC	0.50	1.00	1.00	1.00	0.73	1.00
Energy Education, Gas	Behavior/ Feedback	CLC	0.50	1.00	1.00	1.00	0.73	1.00
Energy Education, Oil	Behavior/ Feedback	CLC	0.50	1.00	1.00	1.00	0.73	1.00
Energy Education, Other	Behavior/ Feedback	CLC	0.50	1.00	1.00	1.00	0.73	1.00

In-Service Rates
All installations have 50% in service rates based on Massachusetts Common Assumptions.

Realization Rates
Realization rates are set to 100% based on Massachusetts Common Assumptions.

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[425]

[424] Massachusetts Common Assumptions
[425] The Cadmus Group, Inc. (2012). *Demand Impact Model.* Prepared for the Massachusetts Program Administrators.

Whole Home – Home Energy Reports

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The Behavior/Feedback programs send energy use reports to participating electric and natural gas customers in order to change customers' energy-use behavior.
Primary Energy Impact: Electric, Natural Gas (Residential Heat)
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Products and Services
End Use: Behavior
Measure Type: Behavior
Core Initiative: Electric - Residential Behavior/Feedback, Gas - Residential Behavior/Feedback

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed and based on calculations from vendor prepared forecasts. [426]

$$\Delta kWh = (kWh_{BASE})(\%SAVE)$$

$$\Delta MMBtu = (MMBtu_{BASE})(\%SAVE)$$

Where:

Unit = One participant household.
$kWh/MMBTU_{BASE}$ = Baseline energy consumption kWh/MMBTu.
%SAVE = Energy savings percent per program participant.

Savings Factors for Home Energy Reports 2016

Measure Name	PA	PA Type	kWh/ MMBTu BASE	% Save	ΔkWh	ΔkW[427]	ΔMMBTu
Home Energy Reports	National Grid	Elec	8,305	1.494%	124.1	0.03

In-Service Rates
In-services rates are 100% since the program tracks all participating customers.

Realization Rates
Realization rates are based on evaluation results.[430]

Coincidence Factors
Coincidence factors are estimated using the demand allocation methodology described in the Cadmus Demand Impact Model (2012). Prepared for Massachusetts Program Administrators.[431]

[430] The savings factors listed are net numbers derived directly from Navigant Consulting and Illume Advising (2015). *Massachusetts Cross-Cutting Behavioral Program Evaluation Opower Results* and already include the impact of the realization rates. The realization rates listed in the Impact Factors table were derived from the report cited above and will be applied to gross vendor estimates going forward.
[431] The Cadmus Group, Inc. (2012). *Demand Impact Model.* Prepared for the Massachusetts Program Administrators.

Whole Home - Code Compliance Support Initiative (CCSI)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The MassSave Code Compliance Support Initiative (CCSI) is focused on improving the energy code compliance rates of residential and commercial buildings in the state. The initiative includes trainings, technical support, and the development of compliance documentation tools. This effort will support code officials, as well as design and construction professionals.
Primary Energy Impact: Electric, Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Residential
Market: Lost Opportunity
End Use: Energy Star Homes
Measure Type: Codes & Standards
Core Initiative: Residential New Construction

Algorithms for Calculating Primary Energy Impact

Energy Savings = Gross Technical Potential * (((1 - Non-Compliance) – Baseline Compliance)/(1 – Baseline Compliance)) * Attribution Factor * Annual Ramp Factor.

Where:

Gross Technical Potential (GTP) - This represents the residential energy savings (kWh and Therms) through building simulations described below under Baseline Efficiency. The Gross technical potential for residential is the difference between homes modelled with the the same UDRH that was used for program activity in 2014 and homes modelled as 100% compliant with 2012 IECC multiplied by the total number of single family and multifamily new construction permits in MA.

Non-Compliance – represents the percentage of potential energy savings not realized at the end of an energy code cycle due to buildings on average not fully meeting code requirements, i.e. the difference between 100% compliance and actual compliance at the end of the energy code cycle[432].

Baseline Compliance – represents the percentage of energy savings realized at the beginning of a new code cycle[433].

Attribution Factor – The percentage of potential energy savings above the normal compliance level, on average, at the end of a typical energy code cycle attributable to PA CCSI efforts[434].

[432] This value is estimated at 17%.
[433] A value of 63% is used based on the following study, NMR Group, Inc. (2014). *Massachusetts Electric and Gas Program Administrators Code Compliance Results for Single-Family Non-Program Homes in Massachusetts*.
[434] A deemed rate of 35% is used.

Annual Ramp Factor – Factor used to simulate how quickly the CCSI reaches the target compliance goal across years. That is, since it takes time for the education efforts of the CCSI to take hold only a portion of the attributable savings are claimed each year during the initiative and ramped up to 100% over the entire three year term[435].

Baseline Efficiency

The baseline efficiency case assumes energy consumption using a measured compliance level[436]. Inputs from the 2014 Massachusetts User Defined Reference Home (UDRH) were used to develop a building energy model, and simulations were run to compare energy consumption with that of the same building prototype built to 2012 IECC prescriptive code specifications. The energy impact was separated into estimates of kWh and Therms for HVAC, DHW, and Lighting (kWh), and then multiplied by the number of single family and low-rise multifamily residential new construction units for Massachusetts as estimated by the 2014 U.S. Census results.

High Efficiency

The high efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code.

Hours

Not Applicable.

Measure Life

20 years.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA Type	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Codes and Standards	RNC	Elec	All	1.00	1.00	1.00	1.00	n/a	n/a
Codes and Standards	RNC	Gas	All	1.00	1.00	n/a	n/a	n/a	n/a

[435] The 2016 – 2018 term includes savings from 2015 – 2018 where the Annual Ramp Factor is 20% for 2015, 30% for 2016, 50% for 2017, and 100% for 2018.
[436] NMR Group, Inc. (2014). *Massachusetts Electric and Gas Program Administrators Code Compliance Results for Single-Family Non-Program Homes in Massachusetts*.

In-Service Rates
All PAs use 100% in service rate.

Savings Persistence Factor
All PAs use 100% savings persistence factor.

Realization Rates
All PAs use 100% realization rates as all adjustments are made via the factors listed in the algorithm above.

Coincidence Factors
Not applicable as no demand savings are counted.

Commercial and Industrial Electric Efficiency Measures

Lighting – Advanced Lighting Design (Performance Lighting)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Advanced lighting design refers to the implementation of various lighting design principles aimed at creating a quality and appropriate lighting experience while reducing unnecessary light usage. This is often done by a professional in a new construction situation. Advanced lighting design uses techniques like maximizing task lighting and efficient fixtures to create a system of optimal energy efficiency and functionality.
Primary Energy Impact: Electric
Secondary Energy Impact: Gas, Oil
Non-Energy Impact: O&M
Sector: Commercial and Industrial
Market: Lost Opportunity
End Use: Lighting
Measure Type: Interior
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = \sum_{i=1}^{n}\left(\frac{LPD_{BASE,i} \times Area_i \times Hours_i}{1000}\right) - \sum_{j=1}^{m}\left(\frac{Count_{EE,j} \times Watts_{EE,j} \times Hours_j}{1000}\right)$$

$$\Delta kW = \sum_{i=1}^{n}\left(\frac{LPD_{BASE,i} \times Area_i}{1000}\right) - \sum_{j=1}^{m}\left(\frac{Count_{EE,j} \times Watts_{EE,j}}{1000}\right)$$

Where:

n	=	Total number of spaces in Space-by-Space Method or 1 for Building Area Method
m		Total number of efficient fixture types installed
$LPD_{BASE,i}$	=	Baseline lighting power density for building or space type i (Watts/ft^2)
$Area_i$	=	Area of building or space *i* (ft^2)
$Hours_i$	=	Annual hours of operation of the lighting equipment for building or space type *i*
$Count_{EE,j}$	=	Quantity of efficient fixture type j
$Watts_{EE,j}$	=	Wattage of fixture type j (Watts)
1000	=	Conversion factor: 1000 watts per 1 kW

Note on HVAC system interaction: Additional Electric savings from cooling system interaction are included in the calculation of adjusted gross savings for Lighting Systems projects. The HVAC interaction adjustment factor is determined from lighting project evaluations and is included in the energy realization rates and demand coincidence factors and realization rates.

Baseline Efficiency

The Baseline Efficiency assumes compliance with lighting power density requirements as mandated by Massachusetts State Building Code, which currently reflects IECC 2012. IECC 2012 offers two compliance paths, the Building Area Method and Space-by-Space Method. For completeness, the lighting power density requirements for both the Building Area Method and the Space-by-Space Method are presented in Appendix A: Common Lookup Tables, Table 1 and Table 2.

High Efficiency

The high efficiency scenario assumes lighting systems that achieve lighting power densities below those required by Massachusetts State Building Code. Actual site lighting power densities should be determined on a case-by-case basis. Please refer to the current year application form for minimum percentage better than code efficiency requirements.

Hours

The annual hours of operation for lighting systems are site-specific and should be determined on a case-by-case basis. If site-specific hours are unavailable, refer to the default hours in Table 5 in Appendix A: Common Lookup Tables.

Measure Life

The measure life for all new construction lighting installations is 15 years.[437]

Secondary Energy Impacts

Heating energy will be increased due to reduced lighting waste heat. This impact is estimated as an average impact in heating fossil fuel consumption per unit of energy saved.

Measure	Energy Type	Impact (MMBtu/ΔkWh)[438]
Interior Lighting	C&I Gas Heat	-0.000175

Non-Energy Impacts

Annual non-energy benefits are claimed due to the reduced operation and maintenance costs associated with the longer measure lived of lamps and ballasts as compared to the base or pre-retrofit case. See Appendix C: Non-Resource Impacts.

[437] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.
[438] DNV KEMA (2013). *Impact Evaluation of 2010 Prescriptive Lighting Installations*. Prepared for Massachusetts Energy Efficiency Program Administrators and Massachusetts Energy Efficiency Advisory Council

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
All	NB and EUL	National Grid	1.00	0.98	1.16	0.85	custom	custom	n/a	n/a
All	NB and EUL	All PAs except National Grid	1.00	1.25	1.01	1.01	0.52	0.44	0.48	.044

Note: Realization Rates and Coincidence Factors have the HVAC Interactive Effect incorporated, see note in Algorithm section.

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
- National Grid: energy and demand RRs derived from impact evaluation of the PAs 2010 Custom Lighting programs. [439]
- All Other PAs: Energy and demand RRs from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting programs[440]. Demand RR is the connected demand RR; energy RR includes connected kWh RR, hours of use RR and HVAC Interactive adjustment

Coincidence Factors
- National Grid, CFs are custom calculated based on site-specific information.
- All Other PAs: All CFs from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting program.[441]

[439] KEMA, Inc. (2012). *Impact Evaluation of 2010 Custom Lighting Installations*. Prepared for Massachusetts Energy Efficiency Program Administrators and Massachusetts Energy Efficiency Advisory Council
[440] DNV KEMA (2013). *Impact Evaluation of 2010 Prescriptive Lighting Installation.*
[441] Ibid

Lighting – Lighting Systems

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of efficient lighting including, but not limited to, efficient fluorescent lamps, ballasts, and fixtures, and solid state lighting.
Primary Energy Impact: Electric
Secondary Energy Impact: Gas, Oil
Non-Energy Impact: O&M
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: Lighting
Measure Type: Interior, Exterior
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit, C&I Small Business, C&I Upstream Lighting

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = \left[\sum_{i=1}^{n} \left(\frac{Count_i * Watts_i}{1000} \right)_{BASE} - \sum_{j=1}^{m} \left(\frac{Count_j * Watts_j}{1000} \right)_{EE} \right] (Hours)$$

$$\Delta kW = \sum_{i=1}^{n} \left(\frac{Count_i * Watts_i}{1000} \right)_{BASE} - \sum_{j=1}^{m} \left(\frac{Count_j * Watts_j}{1000} \right)_{EE}$$

Where:

n	=	Total number of fixture types in baseline or pre-retrofit case
m	=	Total number of installed fixture types
$Count_i$	=	Quantity of existing fixtures of type i (for lost-opportunity, $Count_i = Count_j$).
$Watts_i$	=	Existing fixture or baseline wattage for fixture type i
$Count_j$	=	Quantity of efficient fixtures of type j.
$Watts_j$	=	Efficient fixture wattage for fixture type j.
1000	=	Conversion factor: 1000 watts per kW.
Hours	=	Lighting annual hours of operation.

Note on HVAC system interaction: Additional Electric savings from cooling system interaction are included in the calculation of adjusted gross savings for Lighting Systems projects. The HVAC interaction adjustment factor is determined from lighting project evaluations and is included in the energy realization rates and demand coincidence factors and realization rates (See Impact Factors section).

Baseline Efficiency

For retrofit installations, the baseline efficiency case is project-specific and is determined using actual fixture counts from the existing space. For lost opportunity installations, the baseline efficiency case is determined using assumed baseline wattages for each of the installed fixtures.[442]

High Efficiency

For both new construction and retrofit installations, the high efficiency case is project-specific and is determined using actual fixture counts for the project and the MassSave Wattage Tables in Appendix A: Common Lookup Tables (Table 3 and Table 4).

Hours

The annual hours of operation for lighting systems are site-specific and should be determined on a case-by-case basis with the exception of measures offered via the Upstream Lighting initiative. Upstream Lighting measures use a deemed operating hours value based on the Upstream Lighting Impact evaluation[443] with the exception of Stairwell fixtures which use a deemed operating hours of 8,760. If site-specific hours of operation are unavailable, refer to the default hours presented in Table 5 in Appendix A: Common Lookup Tables.

Measure Life

Lighting system measure lives vary by market sector and equipment type.

Measure Lives for Downstream C&I Lighting Systems[444]

Equipment Type	Measure Life (years)	
	Retrofit	Lost Opportunity
Bulb – CFL screw base	5	N/A
Fluorescent Fixture[445]	13	15
Hardwired CFL	13	15
LED Exit Signs	13	15
LED Lighting Fixtures	13	15
LED Integral Replacement Lamps	13	15
LED Low Bay – Garage & Canopy Fixtures	13	15

[442] Massachusetts Common Assumption: Baseline wattage per fixture type based on comparable code-compliant installations and standard practice.
[443] DNV-GL (2015). *Massachusetts Commercial and Industrial Upstream Lighting Program: "In Storage" Lamps Follow-Up Study, Final Report.*
[444] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1 AND GDS Associates, Inc. (2007). *Measure Life Report: Residential and Commercial/Industrial Lighting and HVAC Measure*s. Prepared for The New England State Program Working Group; Table 2
[445] To account for the effects of EISA (Energy Independence and Security Act of 2007), the lifetime of measures replacing T12s has been reduced for 2016 to 4.30. Beginning in 2007 and into the future T12s will no longer be used as a baseline measure.

Measure Lives for Upstream C&I Lighting Systems[446]

Equipment Type	Measure Life (years)		
	2016	2017	2018
PAR20	8.56	8.12	7.67
PAR30	8.36	7.88	7.40
PAR38	8.50	8.04	7.59
MR16	8.42	7.95	7.48
LED, A-Line	3.66	3.20	2.83
LED, Decoratives	3.93	3.64	3.37
LED Retrofit Kits	5.50	4.98	4.65
LED Stairwell with Occupancy Sensors	7	7	7
G24 LED lamps	13	13	13
TLEDs	12	12	12
T8/T5	10	10	10
T8-28, 25 U-Bend	7	7	7

Secondary Energy Impacts

Heating energy will be increased due to reduced lighting waste heat. This impact is estimated as an average impact in heating fossil fuel consumption per unit of energy saved.

Core Initiative	Measure	Energy Type	Impact (MMBtu/ΔkWh)[447]
NB, EUL, Large Retrofit	Interior Lighting	C&I Gas Heat	-0.00023
NB, EUL, Large Retrofit	Interior Lighting	Oil	-0.00046
Upstream LEDs	Interior Lighting	C&I Gas Heat	-0.00038
Upstream LEDs	Interior Lighting	Oil	-0.00073
Upstream T8/T5	Interior Lighting	C&I Gas Heat	-0.00030
Upstream T8/T5	Interior Lighting	Oil	-0.00059
Small Retrofit	Interior Lighting	Gas Heat	-0.001075
Small Retrofit	Interior Lighting	Oil Heat	-0.000120

Non-Energy Impacts

Annual non-energy benefits are claimed due to the reduced operation and maintenance costs associated with the longer measure lives of lamps and ballasts as compared to the base or pre-retrofit case. See Appendix C: Non-Resource Impacts.

---

[446] For all Upstream measures estimate based on average life of eligible products and average annual operating hours derived from the 2014 Upstream Lighting Impact evaluation. The following measures in this table have been adjusted for the years 2016-2018 to account for the effects of EISA (Energy Independence and Security Act of 2007); PAR lamps, MR16s, LED A-Lines, LED Decoratives, and LED Retrofit Kits.

[447] DNV KEMA (2013). *Impact Evaluation of 2010 Prescriptive Lighting Installations;* DNV-GL (2015). *Massachusetts Commercial and Industrial Upstream Lighting Program: "In Storage" Lamps Follow-Up Study, Final Report, (Percent split between gas and oil based on spreadsheet associated with Optimal 2008 MEMO: Non Electric Benefits Analysis Update)*; **AND** for Small Retrofit; The Cadmus Group (2012). *Non-Controls Lighting Evaluation for the Massachusetts Small Business Direct Install Program: Multi-Season*.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
All	NB, EUL, Large Retrofit	All	1.00	1.12	1.00	1.00	0.83	0.66	0.84	0.67

All	Small Retrofit	All except Eversource (WMECO)	1.00	1.02	0.99	0.99	0.73	0.44	n/a	n/a
All	Small Retrofit	Eversource (WMECO)	1.00	1.02	0.99	0.99	0.73	0.44	0.67	0.42

Note: Realization Rates and Coincidence Factors have the HVAC Interactive Effect incorporated, see note in Algorithm section.

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates

- C&I New Construction: For all measures except Upstream Lighting, all PAs Energy and Demand RRs from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting programs. [448]. Demand RR is the Connected Demand RR; Energy RR includes connected kWh RR, Hours of Use RR and HVAC Interactive adjustment. For Upstream measures (except LED Stairwell fixtures) all PAs Energy and Demand RRs are from the 2015 Upstream Lighting "In Storage" Follow-up Impact evaluation[449]. Demand RR is the Connected Demand RR; Energy RR includes connected kWh RR and HVAC Interactive adjustment. Upstream LED Stairwell fixture RRs are estimates as these fixtures have not been evaluated yet.
- C&I Existing Building Retrofit: All PAs energy and demand RRs from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting programs.[450]. Demand RR is the connected demand RR; energy RR includes connected kWh RR, hours of use RR and HVAC Interactive adjustment
- C&I Small Business: Energy and demand RRs are the statewide results from the 2011 Small C&I Non-Controlled Lighting impact evaluation[451]

Coincidence Factors

- C&I New Construction: For all measures except Upstream Lighting, all CFs are from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting programs.[452] For Upstream measures (except LED Stairwell fixtures) all PAs CFs are from the 2014 Upstream Lighting Impact evaluation.[453] Upstream LED Stairwell fixture CFs are estimates as these fixtures have not been evaluated yet.
- C&I Existing Building Retrofit: All CFs are from 12 month logging impact evaluation of MA PAs LCI prescriptive lighting programs.[454]
- C&I Small Business: All PAs use CF values from the 2012 the Cadmus Non-Controls Multi-Season Lighting Evaluation.[455]

Lighting – Lighting Controls

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of lighting controls in both lost-opportunity and retrofit applications. Promoted technologies include occupancy sensors and daylight dimming controls.
Primary Energy Impact: Electric
Secondary Energy Impact: Heating energy (non-electric)
Non-Energy Impacts: O&M
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: Lighting
Measure Type: Controls
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact[456]

C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit:

$$\Delta kWh = Controlled\ kW * Hours_{Base} * \%Sav$$

$$\Delta kW = (Controlled\ kW)$$

C&I Small Business:

$$\Delta kWh = (Controlled\ kW)(Hours_{BASE} - Hours_{EE})$$

$$\Delta kW = (Controlled\ kW)$$

Where:

Controlled kW	=	Controlled fixture wattage
%Sav	=	Percentage of kWh that is saved by utilizing the control measure.[457]
$Hours_{BASE}$	=	Total annual hours that the connected Watts operated in the pre-retrofit case (retrofit installations) or would have operated with code-compliance controls (new construction installations).
$Hours_{EE}$	=	Annual hours that the connect Watts operate with controls implemented.

[455] The Cadmus Group. (2012). *Non-Controls Lighting Evaluation for the Massachusetts Small Business Direct Install Program: Multi-Season Study*. Prepared for Massachusetts Joint Utilities.
[456] Note of HVAC system interaction: Additional Electric savings from cooling system interaction are included in the calculation of adjusted gross savings for Lighting Systems projects. The HVAC interaction adjustment factor is determined from lighting project evaluations and is included in the energy realization rates and demand coincidence factors and realization rates (See Impact Factors section).
[457] A percent savings value of 24% is used for Occupancy Sensors and a value of 28% for Daylight Dimming based on the following report: DNV KEMA (2014) *Retrofit Lighting Controls Measures Summary of Findings FINAL REPORT*

Baseline Efficiency

The baseline efficiency case assumes no controls (retrofit) or code-compliant controls (new construction).

High Efficiency

The high efficiency case involves lighting fixtures connected to controls that reduce the pre-retrofit or baseline hours of operation.

Hours

The annual hours of reduction for lighting controls are site-specific and should be determined on a case-by-case basis.

Measure Life

Measure Lives for C&I Lighting Controls[458]

Measure	Retrofit	Lost Opportunity
Occupancy Sensors	9	10
Daylight Dimming	9	10

Secondary Energy Impacts

Heating energy will be increased due to reduced lighting waste heat. This impact is estimated as an average impact in heating fossil fuel consumption per unit of energy saved.

Core Initiative	Measure	Energy Type	Impact (MMBtu/ΔkWh)[459]
NB, EUL, Large Retrofit	Interior Lighting	C&I Gas Heat	-0.00092 MMBtu/kWh
NB, EUL, Large Retrofit	Interior Lighting	Oil	-0.00180 MMBtu/kWh
Small Retrofit	Interior Lighting	Gas Heat	-0.000743 MMBtu/kWh
Small Retrofit	Interior Lighting	Oil	-0.000132 MMBtu/kWh

Non-Energy Impacts

Annual non-energy benefits are claimed due to the reduced operation and maintenance costs associated with the longer measure lives of lamps and ballasts as compared to the base or pre-retrofit case. See Appendix C: Non-Resource Impacts.

[458] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.
[459] DNV KEMA (2013). *Impact Evaluation of 2010 Prescriptive Lighting Installations (Percent split between gas and oil based on spreadsheet associated with Optimal 2008 MEMO: Non Electric Benefits Analysis Update)* AND The Cadmus Group, Inc. Lighting – Freezer/Cooler LEDs

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of LED lighting in freezer and/or cooler cases. The LED lighting consumes less energy, and results in less waste heat which reduces the cooling/freezing load.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Lighting
Measure Type: Interior
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = \Delta kWh_{LED} + \Delta kWh_{Heat}$$

$$\Delta kWh_{LED} = \sum_{i=1}^{n}\left(Count_i * kW_i * Hours_i\right)_{BASE} - \sum_{i=1}^{m}\left(Count_j * kW_j * Hours_j\right)_{LED}$$

$$\Delta kWh_{Heat} = \Delta kWh_{LED} * 0.28 * Eff_{RS}$$

$$\Delta kW = \Delta kWh / Hours_j$$

Where:

ΔkWh_{LED}	=	Reduction in lighting energy
ΔkWh_{Heat}	=	Reduction in refrigeration energy due to reduced heat loss from the lighting fixtures
N	=	Total number of lighting fixture types in the pre-retrofit case
M	=	Total number of lighting fixture types in the post-retrofit case
$Count_i$	=	Quantity of type i fixtures in the pre-retrofit case
kW_i	=	Power demand of pre-retrofit lighting fixture type i (kW/fixture)
$Hours_i$	=	Pre-retrofit annual operating hours of fixture type i
$Count_j$	=	Quantity of type j fixtures in the pre-retrofit case
kW_j	=	Power demand of lighting fixture type j (kW/fixture)
$Hours_j$	=	Post-retrofit annual operating hours of fixture type j
0.28	=	Unit conversion between kW and tons calculated as 3,413 Btuh/kW divided by 12,000 Btuh/ton
Eff_{RS}	=	Efficiency of typical refrigeration system: 1.6 kW/ton[464] for C&I Small Business; 1.9 kW/ton for Large C&I[465]

[464] Select Energy (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for Eversource (NSTAR).
[465] DNV KEMA (2013). *Impact Evaluation of 2010 Prescriptive Lighting Installations*

Baseline Efficiency

The baseline efficiency case is the existing lighting fixtures in the cooler or freezer cases.

High Efficiency

The high efficiency case is the installation of LED lighting fixtures on the cooler or freezer cases, replacing the existing lighting fixtures.

Hours

Annual hours of operation are determined on a case-by-case basis and are typically 8760 hours/year. Post-retrofit operating hours are assumed to be the same as pre-retrofit hours unless lighting occupancy sensors were also implemented.

Measure Life

The measure life is 13 years.[466]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Freezer/Cooler LEDs	Large Retrofit	All	1.00	0.94	1.01	1.01	0.99	1.00	1.00	1.00

HVAC – Unitary Air Conditioners

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of high efficiency unitary air conditioning equipment in lost opportunity applications. Air conditioning (AC) systems are a major consumer of electricity and systems that exceed baseline efficiencies can save considerable amounts of energy. This measure applies to air, water, and evaporatively-cooled unitary AC systems, both single-package and split systems.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Cooling
Core Initiative: C&I New Buildings & Major Renovations and C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

For units with cooling capacities less than 65 kBtu/h:

$$\Delta kWh = (kBtu/h)\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}}\right)(EFLH_{Cool})$$

$$\Delta kW = (kBtu/h)\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

For units with cooling capacities equal to or greater than 65 kBtu/h and EER available:

$$\Delta kWh = (kBtu/h)\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)(EFLH_{Cool})$$

$$\Delta kW = (kBtu/h)\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

For units with cooling capacities equal to or greater than 65 kBtu/h and IEER available:

$$\Delta kWh = (kBtu/h)\left(\frac{1}{IEER_{BASE}} - \frac{1}{IEER_{EE}}\right)(Hours_{Cool})(Cap_{adj})$$

$$\Delta kW = (kBtu/h)\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

Where:

ΔkWh	=	Gross annual kWh savings from the measure.
ΔkW	=	Gross connected kW savings from the measure.
kBtu/h	=	Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/h)
$SEER_{BASE}$	=	Seasonal Energy Efficiency Ratio of the baseline equipment.
$SEER_{EE}$	=	Seasonal Energy Efficiency Ratio of the energy efficient equipment.
$EFLH_{Cool}$	=	Cooling equivalent full load hours.
EER_{BASE}	=	Energy Efficiency Ratio of the baseline equipment.
EER_{EE}	=	Energy Efficiency Ratio of the energy efficient equipment.
$IEER_{BASE}$	=	Integrated Energy Efficiency Ratio of the baseline equipment.
$IEER_{EE}$	=	Integrated Energy Efficiency Ratio of the energy efficient equipment.
$Hours_{Cool}$	=	Annual Cooling Hours
Cap_{adj}		Capacity Adjustment Factor: [471] See table below for values.

PA specific Capacity Adjustment Factors for IEER[472]

PA	Capacity Adjustment Factor
National Grid	1.009
Eversource (NSTAR), CLC	0.927
WMECO, Unitil	1.104

Baseline Efficiency

The baseline efficiency case for new installations assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. For 2016, baseline efficiency requirements will follow IECC 2012 with Massachusetts specific amendments. [473] Baseline requirements for 2017 and on have not been finalized.

[471] The capacity adjustment factor is used only when IEER is used to determine energy savings. Since IEER takes into account performance at different loading points, the capacity adjustment factor helps to account for the fact that more load occurs at lower temperatures and capacities. The adjustment factor is greater than 1 for climate zones with lower full load hours and runtime, and the factor is less than 1 for zones with more full load hours and runtime.
[472] DNV GL (2014). *Memo – Develop Modified Runtime from NEEP HVAC Loadshape Study*. Prepared for National Grid and Northeast Utilities. August 20, 2014. Capacity Factors are weighted using information about PA specific load zones.
[473] International Code Council (2012). *2012 International Energy Conservation Code*; Page C-38, Table C403.2.3(1).

Unitary Air Conditioners Baseline Efficiency Levels[474]

Equipment Type	Size Category	Subcategory or Rating Condition	2016 Baseline Efficiency
Air conditioners, air cooled	<65,000 Btu/h[b]	Split system	13.0 SEER
		Single package	13.0 SEER
	≥65,000 Btu/h and <135,000 Btu/h	Split system and single package	11.2 EER[a] 11.4 IEER[a]
	≥135,000 Btu/h and <240,000 Btu/h	Split system and single package	11.0 EER[a] 11.2 IEER[a]
	≥240,000 Btu/h and <760,000 Btu/h	Split system and single package	10.0 EER[a] 10.1 IEER[a]
	≥760,000 Btu/h	Split system and single package	9.7 EER[a] 9.8 IEER[a]
Air conditioners, Water cooled	<65,000 Btu/h	Split system and single package	12.1 EER 12.3 IEER
	≥65,000 Btu/h and <135,000 Btu/h	Split system and single package	12.1 EER[a] 12.3 IEER[a]
	≥135,000 Btu/h and <240,000 Btu/h	Split system and single package	12.5 EER[a] 12.7 IEER[a]
	≥240,000 Btu/h	Split system and single package	12.4 EER[a] 12.6 IEER[a]
Air conditioners, evaporatively cooled	<65,000 Btu/h	Split system and single package	12.1 EER 12.3 IEER
	≥65,000 Btu/h and <135,000 Btu/h	Split system and single package	12.1 EER[a] 12.3 IEER[a]
	≥135,000 Btu/h and <240,000 Btu/h	Split system and single package	12.0 EER[a] 12.2 IEER[a]
	≥240,000 Btu/h	Split system and single package	11.9 EER[a] 12.1 IEER[a]

a. Deduct 0.2 from the required EERs for units with a heating section other than electric heat.[475]
b. Single-phase air-cooled air conditioners <65,000 Btu/h are regulated by the National Appliance Energy Conservation Act of 1987 (NAECA); SEER values are those set by NAECA.

High Efficiency

The high efficiency case assumes the HVAC equipment meets or exceeds the Consortium for Energy Efficiency's (CEE) specification. This specification results in cost-effective energy savings by specifying higher efficiency HVAC equipment while ensuring that several manufacturers produce compliant equipment. The CEE specification is reviewed and updated annually to reflect changes to the ASHRAE and IECC energy code baseline as well as improvements in the HVAC equipment technology. Equipment efficiency is the rated efficiency of the installed equipment for each project.

---

474 For air-cooled air conditioners < 65 kBtu/h, if the actual EER_{EE} is unknown, assume the following conversion from SEER to EER: EER≈SEER/1.1.
475 The PAs do not differentiate between units by heating section types. To be conservative, the highest Baseline Efficiency is assumed for all heating section types in each equipment category.

Hours

Whenever EER or SEER is used to determine energy savings, Equivalent Full Load Hours should be used. Whenever IEER is used to determine energy savings, Annual Cooling Hours should be used. Annual cooling hours or equivalent full load hours for unitary AC equipment may be site specific or default PA specific values made be used, see Table 6 in Appendix A: Common Lookup Tables.

Measure Life

The measure life is 15 years.[476]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}

HVAC – Heat Pump Systems

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure applies to the installation of high-efficiency air cooled, water source, ground water source, and ground source heat pump systems.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heat Pumps
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

For air cooled units with cooling capacities less than 65 kBtu/h:

$$\Delta kWh = \Delta kWh_{Cool} + \Delta kWh_{Heat}$$

$$\Delta kWh_{Cool} = (kBtu/h)\left(\frac{1}{SEER_{BASE}} - \frac{1}{SEER_{EE}}\right)(EFLH_{COOL})$$

$$\Delta kWh_{Heat} = (kBtu/h)\left(\frac{1}{HSPF_{BASE}} - \frac{1}{HSPF_{EE}}\right)(EFLH_{HEAT})$$

$$\Delta kW_{Cool} = (kBtu/h)_{Cool}\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

For all water source, groundwater source, and ground source units. Also for air cooled units with cooling capacities equal to or greater than 65 kBtu/h and EER available:

$$\Delta kWh = \Delta kWh_{Cool} + \Delta kWh_{Heat}$$

$$\Delta kWh_{Cool} = (kBtu/h_{COOL})\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)(EFLH_{COOL})$$

$$\Delta kWh_{Heat} = \frac{(kBtu/h_{HEAT})}{3.412}\left(\frac{1}{COP_{BASE}} - \frac{1}{COP_{EE}}\right)(EFLH_{HEAT})$$

$$\Delta kW_{Cool} = (kBtu/h)_{Cool}\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

For air cooled units with cooling capacities equal to or greater than 65 kBtu/h with available IEER:

$$\Delta kWh = \Delta kWh_{Cool} + \Delta kWh_{Heat}$$

$$\Delta kWh_{Cool} = (kBtu/h_{COOL})\left(\frac{1}{IEER_{BASE}} - \frac{1}{IEER_{EE}}\right)(Hours_{COOL})(Cap_{adj})$$

$$\Delta kWh_{Heat} = \frac{(kBtu/h_{HEAT})}{3.412}\left(\frac{1}{COP_{BASE}} - \frac{1}{COP_{EE}}\right)(EFLH_{HEAT})$$

$$\Delta kW_{Cool} = (kBtu/h)_{Cool}\left(\frac{1}{EER_{BASE}} - \frac{1}{EER_{EE}}\right)$$

Where:

ΔkWh_{COOL}	=	Gross annual cooling mode kWh savings from the measure.
ΔkWh_{HEAT}	=	Gross annual heating mode kWh savings from the measure.
ΔkW_{COOL}	=	Gross annual kW savings from the measure. Heating kW savings are negligible.
kBtu/h[480]	=	Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/h).
$SEER_{BASE}$	=	Seasonal Energy Efficiency Ratio of the baseline equipment.
$SEER_{EE}$	=	Seasonal Energy Efficiency Ratio of the energy efficient equipment.
$EFLH_{COOL}$	=	Cooling mode equivalent full load hours.
$HSPF_{BASE}$	=	Heating Seasonal Performance Factor of the baseline equipment.
$HSPF_{EE}$	=	Heating Seasonal Performance Factor of the energy efficient equipment.
$EFLH_{HEAT}$	=	Heating mode equivalent full load hours.
$kBtu/h_{COOL}$	=	Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/h).
EER_{BASE}	=	Energy Efficiency Ratio of the baseline equipment.
EER_{EE}	=	Energy Efficiency Ratio of the energy efficient equipment.
$kBtu/h_{HEAT}$	=	Capacity of the heating equipment in kBtu per hour. If the heating capacity is unknown, it can be calculated from the cooling capacity[481]
3.412	=	Conversion factor: 3.412 Btu per Wh.
COP_{BASE}	=	Coefficient of performance of the baseline equipment. See table below for values.
COP_{EE}	=	Coefficient of performance of the energy efficient equipment.
$IEER_{BASE}$	=	Integrated Energy Efficiency Ratio of the baseline equipment. See table below for values.
$IEER_{EE}$	=	Integrated Energy Efficiency Ratio of the energy efficient equipment.
$Hours_{Cool}$	=	Annual Cooling Hours
Cap_{adj}		Capacity Adjustment Factor: [482] See table below for values.

[480] For equipment with cooling capacities less than 65 kBtu/h, it is assumed that the heating capacity and cooling capacity are equal.
[481] For Air Source HPs: Heating Capacity = Cooling Capacity * 13,900/12,000 (ratio of heat produced in heating mode to cooling produced in cooling mode). For Water/Ground Source HPs: Heating Capacity = Cooling Capacity * COP/EER (converts the rated cooling output to the rated heating output.
[482] The capacity adjustment factor is used only when IEER is used to determine energy savings. Since IEER takes into account performance at different loading points, the capacity adjustment factor helps to account for the fact that more load occurs at lower temperatures and capacities. The adjustment factor is greater than 1 for climate zones with lower full load hours and runtime, and the factor is less than 1 for zones with more full load hours and runtime.

PA Specific Capacity Adjustment Factors for IEER[483]

PA	Capacity Adjustment Factor
National Grid	1.009
Eversource (NSTAR), CLC	0.927
WMECO, Unitil	1.104

Baseline Efficiency

The baseline efficiency case for new installations assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. For 2016, baseline efficiency requirements will follow IECC 2012 with Massachusetts specific amendments. [484] Baseline requirements for 2017 and on have not been finalized. The table below details the specific efficiency requirements by equipment type and capacity.

Unitary and Applied Heat Pumps Baseline Efficiency Levels[485]

Equipment Type	Size Category (Cooling Capacity)	Subcategory or Rating Condition	2016 Baseline Efficiency	
			Cooling Mode	Heating Mode
Air cooled	<65,000 Btu/h[b]	Split system	13.0 SEER	7.7 HSPF
		Single package	13.0 SEER	7.7 HSPF
	≥65,000 Btu/h and <135,000 Btu/h	Split system and single package / 47°F db/43°F wb outdoor air	11.0 EER[a] 11.2 IEER[a]	3.3 COP
	≥135,000 Btu/h and <240,000 Btu/h	Split system and single package / 47°F db/43°F wb outdoor air	10.6 EER[a] 10.7 IEER[a]	3.2 COP
	≥240,000 Btu/h	Split system and single package / 47°F db/43°F wb outdoor air	9.5 EER[a] 9.6 IEER[a]	3.2 COP
Water source	<17,000 Btu/h	86°F entering water (Cooling Mode) / 68°F entering water (Heating Mode)	11.2 EER	4.2 COP
	≥17,000 Btu/h and <135,000 Btu/h	86°F entering water / 68°F entering water (Heating Mode)	12.0 EER	4.2 COP
Groundwater source	<135,000 Btu/h	59°F entering water (Cooling Mode) / 50°F entering water (Heating Mode)	16.2 EER	3.6 COP
Ground source	<135,000 Btu/h	77°F entering water / 32°F entering water (Heating Mode)	13.4 EER	3.1 COP

db = dry-bulb temperature, °F; wb = wet-bulb temperature, °F.
a. Deduct 0.2 from the required EERs for units with a heating section other than electric heat.[486]
b. Single-phase air-cooled air conditioners <65,000 Btu/h are regulated by the National Appliance Energy Conservation Act of 1987 (NAECA); SEER values are those set by NAECA.

[483] DNV GL (2014). *Memo – Develop Modified Runtime from NEEP HVAC Loadshape Study*. Prepared for National Grid and Northeast Utilities. August 20, 2014. Capacity Factors are weighted using information about PA specific load zones.
[484] International Code Council (2012). *2012 International Energy Conservation Code*; Page C-40, Table C403.2.3(2).
[485] Since IECC 2012 does not provide EER requirements for air-cooled heat pumps < 65 kBtu/h, assume the following conversion from SEER to EER: EER≈SEER/1.1.
[486] The PAs do not differentiate between units by heating section types. To be conservative, the highest baseline efficiency is assumed for all heating section types in each equipment category.

High Efficiency

The high efficiency case assumes the HVAC equipment meets or exceeds the Consortium for Energy Efficiency's (CEE) specification. This specification results in cost-effective energy savings by specifying higher efficiency HVAC equipment while ensuring that several manufacturers produce compliant equipment. The CEE specification is reviewed and updated annually to reflect changes to the ASHRAE and IECC energy code baseline as well as improvements in the HVAC equipment technology. Equipment efficiency is the rated efficiency of the installed equipment for each project.

Hours

Whenever EER or SEER is used to determine energy savings, Equivalent Full Load Hours should be used. Whenever IEER is used to determine energy savings, Annual Operating Hours should be used. Annual cooling hours or equivalent full load hours for heat pump equipment may be site specific or default PA specific hours may be used, see Table 6 in Appendix A: Common Lookup Tables.

Measure Life

The measure life is 15 years.[487]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Heat Pumps	NB, EUL	National Grid	1.00	1.05	1.00	1.00	0.40	0.00	n/a	n/a

HVAC – Demand Control Ventilation (DCV)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The measure controls the quantity of outside air to an air handling system based on detected space CO_2 levels. The installed systems monitor the CO_2 in the spaces or return air and reduce the outside air use when possible to save energy while meeting indoor air quality standards.
Primary Energy Impact: Electric
Secondary Energy Impact: Gas, Oil
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Ventilation
Core Initiative: C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impacts

Gross energy and demand savings for implementation of demand control ventilation are custom **c**alculated using the PA's DCV savings calculation tools. These tools are used to calculate energy and demand savings based on site-specific project details including hours of operation, HVAC system efficiency and total air flow, and enthalpy and temperature set points.[492] Alternatively, the energy and demand savings may be calculated using the following algorithms and inputs:

$$\Delta kWh = (kBtu/h)\left(\frac{1\,Ton}{12\ kBtu/h}\right)(SAVE_{kWh})$$

$$\Delta kW = (kBtu/h)\left(\frac{1\,Ton}{12\ kBtu/h}\right)(SAVE_{kW})$$

Where:

kBtu/h	=	Capacity of the cooling equipment in kBtu per hour
$SAVE_{kWh}$	=	Average annual kWh reduction per ton of cooling capacity: 170 kWh/ton[493]
$SAVE_{kW}$	=	Average kW reduction per ton of cooling capacity: 0.15 kW/ton[494]

Baseline Efficiency

The baseline efficiency case assumes the relevant HVAC equipment has no ventilation control.

---

[492] Detailed descriptions of the DCV Savings Calculation Tools are included in the TRM Library under the "C&I Spreadsheet Tools" folder.
[493] Keena, Kevin (2008). *Analysis of CO2 Control Energy Savings on Unitary HVAC Units.* Prepared for National Grid.
[494] Ibid.

High Efficiency

The high efficiency case is the installation of an outside air intake control based on CO_2 sensors.

Hours

The operating hours are site-specific for custom savings calculations.

Measure Life

The measure life is 10 years.[495]

Secondary Energy Impacts

Custom or default gas and oil heat impacts are counted for DCV measures for reduction in space heating.

Measure	Energy Type	Savings[496]
DCV	C&I Gas Heat	0.001277 MMBtu/kWh
DCV	Oil	0.002496 MMBtu/kWh

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
DCV	NB, EUL	CLC	1.00	1.01	1.09	1.57	0.82	0.05	n/a	n/a
DCV	NB, EUL	Eversource (NSTAR)	1.00	1.01	1.09	1.57	0.82	0.05	n/a	n/a
DCV	NB, EUL	Eversource (WMECO)	1.00	0.91	1.09	1.57	0.82	0.05	n/a	n/a

In-Service Rates
All installations have 100% in service rate.

Realization Rates
For Eversource (NSTAR) and CLC, RRs are from an impact evaluation 2006 HVAC installations.[497] For Eversource (WMECO) the energy RR is from and impact evaluation of 2007/2008 installations.[498]

Coincidence Factors
CFs based on standard assumptions.

HVAC – Dual Enthalpy Economizer Controls (DEEC)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The measure is to upgrade the outside-air dry-bulb economizer to a dual enthalpy economizer. The system will continuously monitor the enthalpy of both the outside air and return air. The system will control the system dampers adjust the outside quantity based on the two readings.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (kBtu/h)\left(\frac{1\,Ton}{12\,kBtu/h}\right)(SAVE_{kWh})$$

$$\Delta kW = (kBtu/h)\left(\frac{1\,Ton}{12\,kBtu/h}\right)(SAVE_{kW})$$

Where:
kBtu/h = Capacity of the cooling equipment in kBtu per hour (1 ton of cooling capacity equals 12 kBtu/h).
$SAVE_{kWh}$ = Average annual kWh reduction per ton of cooling capacity: 289 kWh/ton[499]
$SAVE_{kW}$ = Average kW reduction per ton of cooling capacity: 0.289 kW/ton[500]

Baseline Efficiency

The baseline efficiency case for this measure assumes the relevant HVAC equipment is operating with a fixed dry-bulb economizer.

High Efficiency

The high efficiency case is the installation of an outside air economizer utilizing two enthalpy sensors, one for outdoor air and one for return air.

[499] Patel, Dinesh (2001). *Energy Analysis: Dual Enthalpy Control*. Prepared for Eversource (NSTAR).
[500] Ibid.

Hours

Not applicable.

Measure Life

The measure life is 10 years for lost-opportunity applications.[501] The measure life is 7 years for retrofit installations.[502]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
DEEC	NB, EUL	National Grid	1.00	1.00	1.00	1.00	0.40	0.00	n/a	n/a
DEEC	NB, EUL	Eversource (NSTAR)	1.00	1.01	1.09	1.57	0.45	0.00	n/a	n/a

HVAC – ECM Fan Motors

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of electronically commutated motors (ECMs) on fan powered terminal boxes, fan coils, and HVAC supply fans on small unitary equipment.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Motors
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Electric Energy Impact

$$\Delta kWh = (Design\,CFM)(Box\,Size\,Factor)(\%Flow_{ANNUAL})(Hours)$$
$$\Delta kW_{SP} = (Design\,CFM)(Box\,Size\,Factor)(\%Flow_{SP})$$
$$\Delta kW_{WP} = (Design\,CFM)(Box\,Size\,Factor)(\%Flow_{WP})$$

Where:

Design CFM	=	Capacity of the VAV box in cubic feet per minute
Box Size Factor	=	Savings factor in Watts/CFM. See table below for values.
$\%Flow_{ANNUAL}$	=	Average % of design flow over all operating hours. See table below for values.
$\%Flow_{SP}$	=	Average % of design flow during summer peak period. See table below for values.
$\%Flow_{WP}$	=	Average % of design flow during summer peak period. See table below for values.
Hours	=	Annual operating hours for VAV box fans

ECM Fan Motor Savings Factors [506]

Factor	Box Size	Value	Units
Box Size Factor	< 1000 CFM	0.32	Watts/CFM
Box Size Factor	≥ 1000 CFM	0.21	Watts/CFM
$\%Flow_{ANNUAL}$	All	0.52	-
$\%Flow_{SP}$	All	0.63	-
$\%Flow_{WP}$	All	0.33	-

[506] Factors based on engineering analysis developed at National Grid.

Baseline Efficiency

The baseline efficiency case for this measure assumes the VAV box fans are powered by a single speed fractional horsepower permanent split capacitor (PSC) induction motor.

High Efficiency

The high efficiency case must have a motor installed on new, qualifying HVAC equipment.

Hours

The annual operating hours for ECMs on VAV box fans are site-specific and should be determined on a case-by-case basis.

Measure Life

The measure life is 20 years for lost opportunity applications.[507]

Algorithms for Calculating Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

HVAC – Energy Management System

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The measure is the installation of a new building energy management system (EMS) or the expansion of an existing energy management system for control of non-lighting electric and gas end-uses in an existing building on existing equipment.
Primary Energy Impact: Electric
Secondary Energy Impact: Gas, Oil
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: C&I New Construction, C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impacts

Gross energy and demand savings for energy management systems (EMS) are custom calculated using the PA's EMS savings calculation tools. These tools are used to calculate energy and demand savings based on project-specific details including hours of operation, HVAC system equipment and efficiency and points controlled.[511]

Baseline Efficiency

The baseline for this measure assumes the relevant HVAC equipment has no control.

High Efficiency

The high efficiency case is the installation of a new EMS or the expansion of an existing EMS to control additional non-lighting electric or gas equipment. The EMS must be installed in an existing building on existing equipment.

Hours

Not applicable.

Measure Life

For lost-opportunity applications, the measure life is 15 years.[512] For retrofit applications, the measure life is 10 years.[513]

[511] Descriptions of the EMS savings calculation tools are included in the TRM Library "C&I Spreadsheet Tools" folder.
[512] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.
[513] Ibid.

Secondary Energy Impacts

Heating Impacts: Gas and oil heat impacts are counted for EMS measures for reduction in space heating. If the heating system impacts are not calculated in the EMS savings calculation tool, they can be approximated using the interaction factors described below:

Measure	Energy Type	Impact (MMBtu/ΔkWh)[514]
EMS	C&I Gas Heat	0.001277
EMS	Oil	0.002496

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
EMS	Large Retrofit	National Grid	1.00	1.04	1.03	1.03	custom	custom	n/a	n/a

HVAC – High Efficiency Chiller

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of efficient water-cooled and air-cooled water chilling packages for comfort cooling applications. Eligible chillers include air-cooled, water cooled rotary screw and scroll, and water cooled centrifugal chillers for single chiller systems or for the lead chiller only in multi-chiller systems.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Cooling
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Gross energy and demand savings for chiller installations may be custom calculated using the PA's Chillers savings calculation tool. These tools are used to calculated energy and demand savings based on site-specific chiller plant details including specific chiller plan equipment, operational staging, operating load profile and load profile.[518]

Alternatively, the energy and demand savings may be calculated using the following algorithms and inputs. Please note that consistent efficiency types (FL or IPLV) must be used between the baseline and high efficiency cases. It is recommended that IPLV be used over FL efficiency types when possible.

Air-Cooled Chillers:

$$\Delta kWh = (Tons)\left(\frac{12}{EER_{BASE}} - \frac{12}{EER_{EE}}\right)(Hours)$$

$$\Delta kW = (Tons)\left(\frac{12}{EER_{BASE}} - \frac{12}{EER_{EE}}\right)$$

[518] Descriptions of the Chiller savings calculation tools are included in the TRM Library "C&I Spreadsheet Tools" folder.

Water-Cooled Chillers:

$$\Delta kWh = (Tons)(kW / ton_{BASE} - kW / ton_{EE})(Hours)$$

$$\Delta kW = (Tons)(kW / ton_{BASE} - kW / ton_{EE})(LF)$$

Where:

Tons	=	Rated capacity of the cooling equipment
EER_{BASE}	=	Energy Efficiency Ratio of the baseline equipment. See table below for values.
EER_{EE}	=	Energy Efficiency Ratio of the efficient equipment. Site-specific.
kW/ton_{BASE}	=	Energy efficiency rating of the baseline equipment. See table below for values.
kW/ton_{EE}	=	Energy efficiency rating of the efficient equipment. Site-specific.
Hours	=	Equivalent full load hours for chiller operation

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. As described in Chapter 13 of the aforementioned document, energy efficiency must be met via compliance with the International Energy Conservation Code (IECC) 2012. The table below details the specific efficiency requirements by equipment type and capacity.

Chiller - Minimum Efficiency Requirements[519]

Equipment Type	Size Category (Tons)	Units	Path A		Path B	
			Full Load	IPLV	Full Load	IPLV
Air-cooled chillers	< 150	EER	9.562	12.5	NA	NA
	≥ 150	EER	9.562	12.75	NA	NA
Water cooled, electrically operated, positive displacement (rotary screw and scroll)	< 75	kW/ton	0.780	0.63	0.800	0.600
	≥ 75 and < 150	kW/ton	0.775	0.615	0.790	0.586
	≥ 150 and < 300	kW/ton	0.680	0.580	0.718	0.540
	≥ 300	kW/ton	0.620	0.540	0.639	0.490
Water cooled, electrically operated, centrifugal	< 150	kW/ton	0.634	0.596	0.639	0.450
	≥ 150 and < 300	kW/ton	0.634	0.596	0.639	0.450
	≥ 300 and < 600	kW/ton	0.576	0.549	0.600	0.400
	≥ 600	kW/ton	0.570	0.539	0.590	0.400

Note: Compliance with this standard may be obtained by meeting the minimum requirements of Path A or B, however, both the Full Load and IPLV must be met to fulfill the requirements of Path A or B.

High Efficiency

The high efficiency scenario assumes water chilling packages that exceed the efficiency levels required by Massachusetts State Building Code and meet the minimum efficiency requirements as stated in the New Construction HVAC energy efficiency rebate forms.

[519] International Code Council (2009). *2009 International Energy Conservation Code*;.Table 503.2.3(7). NOTE: values equal to IECC 2012 values: International Code Council (2012). *2012 International Energy Conservation Code*; Page C-46, Table C403.2.3(7).

Hours

The equivalent full load hours of operation for water chilling packages are site-specific and should be determined on a case-by-case basis. If site-specific EFLH is unavailable, default EFLHs of 1,361 should be used.[520]

Measure Life

The measure life is 23 years.[521]

Secondary Energy Impacts

There are no secondary energy impacts counted for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Chillers – IPLV used	NB, EUL	National Grid, Unitil, CLC	1.00	1.20	1.00	1.00	0.49	0.06	0.42	0.04
	NB, EUL	Eversource	1.00	1.00	1.00	1.00	0.42	0.20	0.30	0.15
Chillers – FL used	NB, EUL	All	1.00	2.63	1.00	1.00	0.86	0.10	0.71	0.08

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
- National Grid, Unitil, CLC: RRs based on statewide prospective results from 2015 prescriptive chiller study.[522] Prospective results are to be used in parallel with updated savings factors, as described above, from the same study.
- Eversource: RRs based on retrospective results from 2015 prescriptive chiller study.[523] Retrospective results are applicable to the Eversource Chiller Calculation Tool.

Coincidence Factors
- National Grid, Unitil, CLC: CFs based on prospective statewide results from 2015 prescriptive chiller study.[524]
- Eversource: Note that values stored in the CF fields are actually retrospective demand RRs for Eversource from the 2015 prescriptive chiller study.[525]

HVAC – Hotel Occupancy Sensors

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The measure is to the installation of hotel occupancy sensors (HOS) to control packaged terminal AC units (PTACs) with electric heat, heat pump units and/or fan coil units in hotels that operate all 12 months of the year.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on evaluation results:

$$\Delta kWh = SAVE_{kWh}$$
$$\Delta kW = SAVE_{kW}$$

Where:

Unit	=	Installed hotel room occupancy sensor
$SAVE_{kWh}$	=	Average annual kWh reduction per unit: 438 kWh[526]
$SAVE_{kW}$	=	Average annual kWh reduction per unit: 0.09 kW[527]

Baseline Efficiency

The baseline efficiency case assumes the equipment has no occupancy based controls.

High Efficiency

The high efficiency case is the installation of controls that include (a) occupancy sensors, (b) window/door switches for rooms that have operable window or patio doors, and (c) set back to 65 F in the heating mode and set forward to 78°F in the cooling mode when occupancy detector is in the unoccupied mode. Sensors controlled by a front desk system are not eligible.

[526] MassSave (2010). *Energy Analysis: Hotel Guest Occupancy Sensors*. Prepared for National Grid and Eversource (NSTAR).
[527] Ibid.

Hours

Not applicable.

Measure Life

For retrofit applications, the measure life is 10 years.[528]

Secondary Energy Impacts

There are no secondary energy impacts.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
HOS	Large Retrofit	National Grid	1.00	1.00	1.00	1.00	0.30	0.70	n/a	n/a
HOS	Large Retrofit	Eversource (NSTAR), CLC	1.00	1.01	1.09	1.57	0.82	0.05	n/a	n/a
HOS	Large Retrofit	Unitil	1.00	1.00	1.00	1.00	0.82	0.05	n/a	n/a
HOS	Large Retrofit	Eversource (WMECO)	1.00	0.91	1.09	1.57	0.82	0.05	0.00	0.00
HOS	Small Retrofit	CLC	1.00	1.01	1.09	1.57	0.82	0.05	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
- National Grid: RRs based on engineering estimates.
- Eversource (NSTAR), CLC energy and demand RRs from impact evaluation of NSTAR 2006 HVAC installations[529]
- Unitil: Energy and demand RRs are 100% based on no evaluations.
- Eversource (WMECO): Energy RRs are based on end use from 2007/2008 Large C&I Programs impact evaluation[530], demand RRs from impact evaluation of NSTAR 2006 HVAC installations referenced above.

Coincidence Factors
- National Grid: CFs based on engineering estimates.
- Eversource (NSTAR), CLC, Unitil, Eversource (WMECO): on-peak CFs based on standard assumptions.
- Eversource (WMECO): seasonal CFs set to 0.00 based on assumption that no savings occur during seasonal peak periods.

HVAC – Programmable Thermostats

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure involves the installation of a programmable thermostat for cooling and/or heating systems in spaces with either no or erratic existing control.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: C&I Small Business

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (SQFT)(SAVE_{kWh})$$
$$\Delta kW = (SQFT)(SAVE_{kW})$$

Where:
SQFT = Square feet of controlled space
$SAVE_{kWh}$ = Average kW reduction per SQFT of controlled space. See table below.
$SAVE_{kW}$ = Average annual kWh reduction per SQFT of controlled. See table below.

Savings Factors (Save)[531]

Equipment Type	$SAVE_{kWh}$ (kWh/SQFT)	$SAVE_{kW}$ (kW/SQFT)
Cool Only No Existing Control	0.539	0.00
Cool Only Erratic Existing Control	0.154	0.00
Heat Only No Existing Control	0.418	0.00
Heat Only Erratic Existing Control	0.119	0.00
Cool and Heat No Existing Control	0.957	0.00
Cool and Heat Erratic Existing Control	0.273	0.00
Heat Pump No Existing Control	0.848	0.00
Heat Pump Erratic Existing Control	0.242	0.00

Baseline Efficiency

The baseline efficiency case includes spaces with either no or erratic heating and/or cooling control as indicated in the equipment type selection.

[531] Massachusetts common assumptions.

High Efficiency

The high efficiency case includes control of the space cooling and/or heating system as indicated in the equipment type selection.

Hours

Not applicable.

Measure Life

For retrofit applications, the measure life is 8 years.[532]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Thermostats	Small Retrofit	National Grid	1.00	1.00	1.00	1.00	0.00	0.00	n/a	n/a
Thermostats	Small Retrofit	Eversource (NSTAR), CLC	1.00	0.91	0.92	0.92	0.00	0.00	n/a	n/a
Thermostats	Small Retrofit	Unitil	1.00	1.00	1.00	1.00	0.00	0.00	n/a	n/a
Thermostats	Small Retrofit	Eversource (WMECO)	1.00	1.00	0.92	0.92	0.00	0.00	0.00	0.00

In-Service Rates
All installations have 100% in service rate since PA programs include verification of equipment installations.

Realization Rates
- National Grid, Unitil: RRs set to 100% based on no evaluations.
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.
- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program[533], demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors
- All PAs CFs set to zero since no savings are expected during peak periods.

532 Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.

Refrigeration – Door Heater Controls

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of controls to reduce the run time of door and frame heaters for freezers and walk-in or reach-in coolers. The reduced heating results in a reduced cooling load.[534]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Controls
Core Initiative: C&I Small Business, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = kW_{DH} * \%OFF * 8760$$
$$\Delta kW = kW_{DH} * \%OFF$$

Where:

kW_{DH}	=	Total demand of the door heater, calculated as Volts * Amps / 1000
8760	=	Door heater annual run hours before controls
%OFF		Door heater Off time[535]: 46% for freezer door heaters or 74% for cooler door heaters)

Baseline Efficiency

The baseline efficiency case is a cooler or freezer door heater that operates 8,760 hours per year without any controls.

High Efficiency

The high efficiency case is a cooler or freezer door heater connected to a heater control system, which controls the door heaters by measuring the ambient humidity and temperature of the store, calculating the dew point, and using pulse width modulation (PWM) to control the anti-sweat heater based on specific algorithms for freezer and cooler doors. Door temperature is typically maintained about 5^{o}F above the store air dew point temperature.[536]

[534] The assumptions and algorithms used in this section are specific to NRM products.
[535] The value is an estimate by NRM based on hundreds of downloads of hours of use data from Door Heater controllers. These values are also supported by Select Energy Services, Inc. (2004). *Cooler Control Measure Impact Spreadsheet User's Manual*. Prepared for NSTAR.
[536] Select Energy Services, Inc. (2004). *Analysis of Cooler Control Energy Conservation Measures*. Prepared for NSTAR.

Hours

Pre-retrofit hours are 8,760 hours per year. After controls are installed, the door heaters in freezers are on for an average 4,730 hours/year (46% off time) and the door heaters for coolers are on for an average 2,278 hours/year (74% off time).

Measure Life

The measure life for cooler and freezer door heater controls is 10 years.[537]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Door Heater Control	Small Retrofit	National Grid	1.00	1.00	1.00	1.00	0.50	1.00	n/a	n/a
Door Heater Control	Small Retrofit	Eversource (NSTAR)	1.00	0.91	0.92	0.92	0.50	1.00	n/a	n/a
Door Heater Control	Small Retrofit	Unitil	1.00	1.00	1.00	1.00	0.50	1.00	n/a	n/a
Door Heater Control	Small Retrofit	Eversource (WMECO)	1.00	0.86	0.92	0.92	0.50	1.00	0.10	0.10
Door Heater Control	Small Retrofit, Large Retrofit	CLC	1.00	0.91	0.92	0.92	0.50	1.00	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PAs' programs include verification of equipment installations.

Realization Rates
- National Grid: energy RR based on staff estimates.
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.
- Unitil: RRs set to 100% based on no evaluations.
- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program,[538] demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors
- All PAs: on-peak CFs from the 1995 HEC study of walk-in cooler anti-sweat door heater controls.[539]
- Eversource (WMECO): seasonal CFs based on staff estimates.

[537] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.

Refrigeration – Novelty Cooler Shutoff

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of controls to shut off a facility's novelty coolers for non-perishable goods based on pre-programmed store hours. Energy savings occur as coolers cycle off during facility unoccupied hours.[540]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Controls
Core Initiative: C&I Small Business, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = (kW_{NC})(DC_{AVG})(HoursOFF)$$
$$\Delta kW = 0$$

Where:

ΔkW	=	0 since savings are assumed to occur during evening hours and are therefore not coincident with either summer or winter peak periods.
kW_{NC}	=	Power demand of novelty cooler calculated from equipment nameplate data and estimated 0.85 power factor[541]
HoursOFF	=	Potential hours off every night per year, estimated as one less than the number of hours the store is closed per day
DC_{AVG}	=	Weighted average annual duty cycle: 48.75%[542]

Baseline Efficiency

The baseline efficiency case is the novelty coolers operating 8,760 hours per year.

High Efficiency

The high efficiency case is the novelty coolers operating fewer than 8,760 hours per year since they are controlled to cycle each night based on pre-programmed facility unoccupied hours.

---

[540] The assumptions and algorithms used in this section are specific to NRM products.
[541] Conservative value based on 15 years of NRM field observations and experience.
[542] Ibid; the estimated duty cycles for Novelty Coolers are supported by Select Energy Services, Inc. (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for NSTAR. The study gives a less conservative value than used by NRM.

Hours

Hours reduced per day are estimated on a case-by-case basis, and are typically calculated as one less than the number of hours per day that the facility is closed each day.

Measure Life

The measure life is 10 years.[543]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Novelty Cooler Shutoff	Small Retrofit	National Grid	1.00	1.00	1.00	1.00	0.00	0.00
Novelty Cooler Shutoff	Small Retrofit	Eversource (NSTAR)	1.00	0.91	0.92	0.92	0.00	0.00
Novelty Cooler Shutoff	Small Retrofit, Large Retrofit	CLC	1.00	0.91	0.92	0.92	0.00	0.00
Novelty Cooler Shutoff	Small Retrofit	Unitil	1.00	1.00	1.00	1.00	0.00	0.00
Novelty Cooler Shutoff	Small Retrofit	Eversource (WMECO)	1.00	0.86	0.92	0.92	0.00	0.00

In-Service Rates
All installations have 100% in service rate since all PAs' programs include verification of equipment installations.

Realization Rates
- National Grid: energy RR based on staff estimates.
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit impact evaluations.
- Unitil: RRs set to 100% based on no evaluations.
- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program[544], demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors
Coincidence factors are set to zero since demand savings typically occur during off-peak hours.

[543] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.

Refrigeration – ECM Evaporator Fan Motors for Walk–in Coolers and Freezers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of various sizes of electronically commutated motors (ECMs) in walk-in coolers and freezers to replace existing evaporator fan motors.[545]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Motors
Core Initiative: C&I Small Business, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = \Delta kWh_{Fan} + \Delta kWh_{Heat}$$
$$\Delta kWh_{Fan} = kW_{Fan} * LRF * Hours$$
$$\Delta kWh_{Heat} = \Delta kWh_{Fan} * 0.28 * Eff_{RS}$$
$$\Delta kW = \Delta kWh / 8{,}760$$

Where:

ΔkWh_{Fan}	=	Energy savings due to increased efficiency of evaporator fan motor
ΔkWh_{Heat}	=	Energy savings due to reduced heat from the evaporator fans
kW_{Fan}	=	Power demand of evaporator fan calculated from equipment nameplate data and estimated 0.55 power factor/adjustment[546]: Amps x Voltage x PF x √Phase
LRF	=	Load reduction factor for motor replacement (65%)[547]
Hours	=	Annual fan operating hours.
0.28	=	Conversion factor between kW and tons: 3,413 Btuh/kW divided by 12,000 Btuh/ton
Eff_{RS}	=	Efficiency of typical refrigeration system: 1.6 kW/ton[548]
ΔkW	=	Average demand savings
8,760	=	Hours per year

[545] The assumptions and algorithms used in this section are specific to NRM products.
[546] Conservative value based on 15 years of NRM field observations and experience.
[547] Load factor is an estimate by NRM based on several pre- and post-meter readings of installations; the value is supported by RLW Analytics (2007). *Small Business Services Custom Measure Impact Evaluation.* Prepared for National Grid.
[548] Assumed average refrigeration efficiency for typical installations. Conservative value based on 15 years of NRM field observations and experience. Value supported by Select Energy (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for NSTAR.

Baseline Efficiency

The baseline efficiency case is an existing evaporator fan motor.

High Efficiency

The high efficiency case is the replacement of existing evaporator fan motors with ECMs.

Hours

The annual operating hours are assumed to be 8,760 * (1-%OFF), where %OFF = 0 if the facility does not have evaporator fan controls or %OFF = 46% if the facility has evaporator fan controls (4,030 hours). See section: Refrigeration – Evaporator Fan Controls for more on %OFF value.

Measure Life

The measure life is 15 years.[549]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings[550]

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}

<u>**In-Service Rates**</u>
All installations have 100% in service rate since PA programs include verification of equipment installations.

<u>**Realization Rates**</u>

- National Grid: RRs set to 100% since changes to calculation methodology made based on 2005 Custom SBS program evaluation. [551]
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.
- Unitil: RRs set to 100% based on no evaluations.

[549] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; 15-year measure life for retrofit motor installations.
[550] RLW Analytics (2007). *Small Business Services Custom Measure Impact Evaluation.* Prepared for National Grid.
[551] RLW Analytics (2007). *Impact Evaluation Analysis of the 2005 Custom SBS Program*. Prepared for National Grid.

- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program[552], demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors

Coincident factors are set to 1 since demand savings is average.

[552] The Cadmus Group, Inc. (2010). *Western Massachusetts Small Business Energy Advantage Impact Evaluation Report Program Year 2008*. Prepared for Western Massachusetts Electric Company.

Refrigeration – Case Motor Replacement

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of electronically commutated motors (ECMs) in multi-deck and freestanding coolers and freezers, typically on the retail floor of convenience stores, liquor stores, and grocery stores.[553]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Motors
Core Initiative: C&I Small Business

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = \Delta kWh_{Motor} + \Delta kWh_{Heat}$$
$$\Delta kWh_{motor} = kW_{Motor} * LRF * Hours$$
$$\Delta kWh_{heat} = \Delta kWh_{Motor} * 0.28 * Eff_{RS}$$
$$\Delta kW = \Delta kWh / 8{,}760$$

Where:

ΔkWh_{Motor}	=	Energy savings due to increased efficiency of case motor
ΔkWh_{Heat}	=	Energy savings due to reduced heat from evaporator fans
kW_{motor}	=	Metered load of case motor
LRF	=	Load reduction factor: 53% when shaded pole motors are replaced, 29% when PSC motors are replaced[554]
Hours	=	Average runtime of case motors (8,500 hours)[555]
0.28	=	Conversion of kW to tons: 3,413 Btuh/kW divided by 12,000 Btuh/ton.
Eff_{RS}	=	Efficiency of typical refrigeration system (1.6 kW/ton) [556]
ΔkW	=	Average demand savings
8,760	=	Hours per year

[553] The assumptions and algorithms used in this section are specific to NRM products.
[554] Load factor is an estimate by NRM based on several pre- and post-meter readings of installations
[555] Conservative value based on 15 years of NRM field observations and experience.
[556] Assumed average refrigeration efficiency for typical installations. Conservative value based on 15 years of NRM field observations and experience. Value supported by Select Energy (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for NSTAR.

Baseline Efficiency

The baseline efficiency case is the existing case motor.

High Efficiency

The high efficiency case is the replacement of the existing case motor with an ECM.

Hours

Hours are the annual operating hours of the case motors.

Measure Life

The measure life is 15 years.[557]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Case ECMs	Small Retrofit	National Grid	1.00	1.00	1.00	1.00	1.00	1.00	n/a	n/a
Case ECMs	Small Retrofit	Eversource (NSTAR), CLC	1.00	0.91	0.92	0.92	1.00	1.00	n/a	n/a
Case ECMs	Small Retrofit	Unitil	1.00	1.00	1.00	1.00	1.00	1.00	n/a	n/a
Case ECMs	Small Retrofit	Eversource (WMECO)	1.00	0.86	0.92	0.92	1.00	1.00	1.00	1.00

In-Service Rates
All installations have 100% in service rate since all PAs' programs include verification of equipment installations.

Realization Rates

- National Grid: set to 100% since changes to calculation methodology based on 2005 Custom SBS evaluation. [558]
- Unitil: RRs set to 100% based on no evaluations.
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit impact evaluations.
- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program[559] and demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors
All PAs set coincident factors to 1.00 since demand savings are average.

Refrigeration – Cooler Night Covers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of retractable aluminum woven fabric covers for open-type refrigerated display cases, where the covers are deployed during the facility unoccupied hours in order to reduce refrigeration energy consumption.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Night Cover
Core Initiative: C&I Small Business

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = (Width)(Save)(Hours)$$
$$\Delta kW = (Width)(Save)$$

Where:
ΔkWh = Energy savings
ΔkW = Connected load reduction
Width = Width of the opening that the night covers protect (ft)
Save = Savings factor based on the temperature of the case (kW/ft). See table below.
Hours = Annual hours that the night covers are in use

Savings Factors[560]

Cooler Case Temperature	Savings Factor
Low Temperature (-35 F to -5 F)	0.03 kW/ft
Medium Temperature (0 F to 30 F)	0.02 kW/ft
High Temperature (35 F to 55 F)	0.01 kW/ft

Baseline Efficiency

The baseline efficiency case is the annual operation of open-display cooler cases.

[560] CL&P Program Savings Documentation for 2011 Program Year (2010). Factors based on Southern California Edison (1997). *Effects of the Low Emissive Shields on Performance and Power Use of a Refrigerated Display Case.*

High Efficiency

The high efficiency case is the use of night covers to protect the exposed area of display cooler cases during unoccupied hours.

Hours

Hours represent the number of annual hours that the night covers are in use, and should be determined on a case-by-case basis.

Measure Life

The measure life is 10 years.[561]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}

Cooler Night Cover	Small Retrofit	Eversource (NSTAR), CLC	1.00	0.91	0.92	0.92	0.00	0.00	n/a	n/a
Cooler Night Cover	Small Retrofit	Unitil	1.00	1.00	1.00	1.00	0.00	0.00	n/a	n/a
Cooler Night Cover	Small Retrofit	Eversource (WMECO)	1.00	0.86	0.92	0.92	0.00	0.00	0.00	0.00

In-Service Rates
All installations have 100% in service rate since all PAs' programs include verification of equipment installations.

Realization Rates
- National Grid, Unitil: RRs set to 100% based on no evaluations.
- Eversource (NSTAR), CLC: RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.
- Eversource (WMECO): Energy RRs from impact evaluation of 2008 small retrofit program.[562] Demand RRs based on NSTAR 2002-2004 small retrofit program impact evaluations.

Coincidence Factors
Coincidence factors are set to zero since demand savings typically occur during off-peak hours.

561 Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Page 4-5 to 4-6.
562 The Cadmus Group, Inc. (2010). *Western Massachusetts Small Business Energy Advantage Impact Evaluation Report Program Year 2008*. Prepared for Western Massachusetts Electric Company.

Refrigeration – Electronic Defrost Control

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: A control mechanism to skip defrost cycles when defrost is unnecessary.[563]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Controls
Core Initiative: C&I Small Business, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = \Delta kWh_{Defrost} + \Delta kWh_{Heat}$$
$$\Delta kWh_{Defrost} = kW_{Defrost} * Hours * DRF$$
$$\Delta kWh_{Heat} = \Delta kWh_{Defrost} * 0.28 * Eff_{RS}$$
$$\Delta kW = \Delta kWh / 8{,}760$$

Where:

$\Delta kWh_{Defrost}$	=	Energy savings resulting from an increase in operating efficiency due to the addition of electronic defrost controls.
ΔkWh_{Heat}	=	Energy savings due to reduced heat from reduced number of defrosts.
$kW_{Defrost}$	=	Load of electric defrost.
Hours	=	Number of hours defrost occurs over a year without the defrost controls.
DRF	=	Defrost reduction factor- percent reduction in defrosts required per year (35%)[564]
0.28	=	Conversion of kW to tons: 3,413 Btuh/kW divided by 12,000 Btuh/ton.
Eff_{RS}	=	Efficiency of typical refrigeration system (1.6 kW/ton)[565]
ΔkW	=	Average demand savings
8,760	=	Hours per year

Baseline Efficiency

The baseline efficiency case is an evaporator fan electric defrost system that uses a time clock mechanism to initiate defrost.

---

563 The assumptions and algorithms used in this section are specific to NRM products.
564 Ibid; supported by 3rd party evaluation: Independent Testing was performed by Intertek Testing Service on a Walk-in Freezer that was retrofitted with Smart Electric Defrost capability.
565 Assumed average refrigeration efficiency for typical installations. Conservative value based on 15 years of NRM field observations and experience. Value supported by Select Energy (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for NSTAR.

High Efficiency

The high efficiency case is an evaporator fan defrost system with electric defrost controls.

Hours

The number of defrost cycles is estimated to decrease by 35% from an average number of defrost cycles of 1460 defrosts/year at 40 minutes each for a total of 973 hours/year.[566] The number of defrost cycles with the defrost controls is 949 cycles/year, or 633 hours/year.

Measure Life

The measure life is 10 years.[567]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Refrigeration – Evaporator Fan Controls

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of controls to modulate the evaporator fans based on temperature control. Energy savings include: fan energy savings from reduced fan operating hours, refrigeration energy savings from reduced waste heat, and compressor energy savings resulting from the electronic temperature control. Electronic controls allow less fluctuation in temperature, thereby creating savings.[569]
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Controls
Core Initiative: C&I Small Business, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = \Delta kWh_{Fan} + \Delta kWh_{Heat} + \Delta kWh_{Control}$$
$$\Delta kWh_{Fan} = kW_{Fan} * 8760 * \%OFF$$
$$\Delta kWh_{Heat} = \Delta kWh_{Fan} * 0.28 * Eff_{RS}$$
$$\Delta kWh_{Control} = \left[kW_{CP} * Hours_{CP} + kW_{Fan} * 8760 * (1 - \%Off)\right] * 5\%$$
$$\Delta kW = \Delta kWh / 8760$$

Where:

ΔkWh_{Fan}	=	Energy savings due to evaporator being shut off
ΔkWh_{Heat}	=	Energy savings due to reduced heat from the evaporator fans
$\Delta kWh_{Control}$	=	Energy savings due to the electronic controls on compressor and evaporator
kW_{Fan}	=	Power demand of evaporator fan calculated from equipment nameplate data and estimated 0.55 power factor/ adjustment[570]: Amps x Voltage x PF x √Phase
%OFF	=	Percent of annual hours that the evaporator is turned off: 46%[571]
0.28	=	Conversion of kW to tons: 3,413 Btuh/kW divided by 12,000 Btuh/ton.
Eff_{RS}	=	Efficiency of typical refrigeration system: 1.6 kW/ton[572]
kW_{CP}	=	Total power demand of compressor motor and condenser fan calculated from equipment

[569] The assumptions and algorithms used in this section are specific to NRM products.
[570] Conservative value based on 15 years of NRM field observations and experience.
[571] The value is an estimate by NRM based on hundreds of downloads of hours of use data. These values are also supported by Select Energy Services, Inc. (2004). *Cooler Control Measure Impact Spreadsheet User's Manual*. Prepared for NSTAR.
[572] Assumed average refrigeration efficiency for typical installations. Conservative value based on 15 years of NRM field observations and experience. Value supported by Select Energy (2004). *Cooler Control Measure Impact Spreadsheet Users' Manual*. Prepared for NSTAR.

		nameplate data and estimated 0.85 power factor[573]: Amps x Voltage x PF x √Phase
$Hours_{CP}$	=	Equivalent annual full load hours of compressor operation: 4,072 hours[574]
5%	=	Reduced run-time of compressor and evaporator due to electronic temperature controls[575]
ΔkW	=	Average demand savings
8,760	=	Hours per year

Baseline Efficiency

The baseline efficiency case assumes evaporator fans that run 8,760 annual hours with no temperature control.

High Efficiency

The high efficiency case is the use of an energy management system to control evaporator fan and compressor operation based on temperature.

Hours

The operation of the fans is estimated to be reduced by 46% from the 8,760 hours in the base case scenario.

Measure Life

The measure life is 10 years[576].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

[573] This value is an estimate by NRM based on hundreds of downloads of hours of use data from the electronic controller.
[574] Conservative value based on 15 years of NRM field observations and experience.
[575] Conservative estimate supported by less conservative values given by several utility-sponsored 3rd Party studies including: Select Energy Services, Inc. (2004). *Analysis of Cooler Control Energy Conservation Measures*. Prepared for NSTAR.
[576] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Evap Fan Control	Small Retrofit	National Grid	1.00	1.00	1.00	1.00	1.00	1.00	n/a	n/a

Refrigeration – Vending Misers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Controls can significantly reduce the energy consumption of vending machine lighting and refrigeration systems. Qualifying controls must power down these systems during periods of inactivity but, in the case of refrigerated machines, must always maintain a cool product that meets customer expectations. This measure applies to refrigerated beverage vending machines, non-refrigerated snack vending machines, and glass front refrigerated coolers. This measure should not be applied to ENERGY STAR® qualified vending machines, as they already have built-in controls.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: Refrigeration
Measure Type: Controls
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on the following algorithms and assumptions:

$$\Delta kWh = (kW_{RATED})(Hours)(SAVE)$$
$$\Delta kW = \Delta kWh / Hours$$

Where:

kW_{rated} = Rated kW of connected equipment. See for default rated kW by connected equipment type.
Hours = Operating hours of the connected equipment: default of 8,760 hours
SAVE = Percent savings factor for the connected equipment. See table below for values.

Vending Machine and Cooler Controls Savings Factors [579]

Equipment Type	kWRATED	SAVE (%)	ΔkW	ΔkWh
Refrigerated Beverage Vending Machines	0.40	46	0.184	1612
Non-Refrigerated Snack Vending Machines	0.085	46	0.039	343
Glass Front Refrigerated Coolers	0.46	30	0.138	1208

[579] USA Technologies Energy Management Product Sheets (2006). http://www.usatech.com/energy_management/energy_productsheets.php. Accessed 9/1/09.

Baseline Efficiency

The baseline efficiency case is a standard efficiency refrigerated beverage vending machine, non-refrigerated snack vending machine, or glass front refrigerated cooler without a control system capable of powering down lighting and refrigeration systems during periods of inactivity.

High Efficiency

The high efficiency case is a standard efficiency refrigerated beverage vending machine, non-refrigerated snack vending machine, or glass front refrigerated cooler with a control system capable of powering down lighting and refrigeration systems during periods of inactivity.

Hours

It is assumed that the connected equipment operates 24 hours per day, 7 days per week for a total annual operating hours of 8,760.

Measure Life

The measure life is 5 years.[580]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Food Service – Commercial Electric Ovens

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® commercial convection oven or commercial combination oven. ENERGY STAR® commercial ovens save energy during preheat, cooking and idle times due to improved cooking efficiency, and preheat and idle energy rates. Combination ovens can be used either as convection ovens or as steamers.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator and the Food Services Technology Center Life Cycle Cost Calculator:

$$\Delta kWh = \Delta kWh$$
$$\Delta kW = \Delta kWh / Hours$$

Where:
ΔkWh = gross annual kWh savings from the measure. See table below.
ΔkW = gross average kW savings from the measure. See table below.
Hours = Annual hours of operation. See Hours section below.

Energy Savings for Commercial Ovens[585]

Equipment Type	ΔkW	ΔkWh
Full Size Convection Oven	0.44	1,661
Combination Oven	1.40	5,271

Baseline Efficiency

The baseline efficiency case is a convection oven with a cooking energy efficiency of 65%, production capacity of 90 pounds per hour, and idle energy rate of 2.0 kW. The baseline efficiency case for a combination oven is a commercial combination oven with a convection cooking energy efficiency of 72%

[585] Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Oven Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015.

with a production capacity of 79 pounds per hour for convection mode and 49% steam cooking energy efficiency, with a production capacity of 126 pounds per hour for steam mode. Idle energy is assumed to be 1.3 kW for convection mode and 5.3 kW for steam mode.

High Efficiency

The high efficiency case is a convection oven with a cooking energy efficiency of 71%, production capacity of 90 pounds per hour, and idle energy rate of 1.6 kW. The high efficiency case for a combination oven is a commercial combination oven with a cooking energy efficiency of 76% with a production capacity of 119 pounds per hour for convection mode, and 55% cooking energy efficiency with a production capacity of 177 pounds per hour for steam mode, and idle energy rate of 1.3 kW for convection mode and 2.0 kW for steam mode.

Hours

Ovens assumed to operate 313 days per year[586] for 12 hours a day, or 3,756 hours.[587]

Measure Life

The measure life for a new commercial electric oven is 12 years.[588]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Electric Ovens	NB, EUL	All	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

586 The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr
587 Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Oven Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015.
588 Ibid.

Food Service – Commercial Electric Steam Cooker

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® commercial steam cooker. ENERGY STAR® steam cookers save energy during cooling and idle times due to improved cooking efficiency and idle energy rates.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Water, Wastewater
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = (SAVE)(Quantity)(Hours)$$

$$\Delta kW = (SAVE)(Quantity)$$

Where:

ΔkWh	=	gross annual kWh savings from the measure. With default Quantity, average savings are 8,547 kWh.
ΔkW	=	average kW savings from the measure. With default Quantity, average savings are 2.28 kW
SAVE	=	Demand savings per pan: 0.76 kW/pan [589]
Quantity	=	Number of pans. Default of 3 pans.
Hours	=	Average annual equipment operating hours. See Hours section below.

Baseline Efficiency

The Baseline Efficiency case is an electric steam cooker with a cooking efficiency of 30%, pan production capacity of 23.3 pounds per hour, preheat energy of 1.5 kWh, and idle energy rate of 1.2 kW.

[589] Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Steam Cooker Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx > except for hours of operation, see Hours section below. Tool downloaded August 10, 2015.

High Efficiency

The High Efficiency case is an ENERGY STAR® electric steam cooker with a cooking energy efficiency of 50%, pan production capacity of 16.7 pounds per hour, preheat energy of 1.5 kWh, and an idle energy rate of 0.4 kW.

Hours

Steamers are assumed to operate 313 days per year.[590] The average steam cooker is assumed to operate 12 hours per day[591], or 3,756 hours per year.

Measure Life

The measure life for a new steamer is 12 years.[592]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Water and wastewater is saved due to the improved cooking efficiency of the high efficiency equipment.

Benefit Type	Description	Savings[593]
C&I Water	Annual water savings per unit	139,000 gallons/unit
C&I Waste Water	Annual wastewater savings per unit	139,000 gallons/unit

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Electric Steam Cooker	NB, EUL	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

---

[590] The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr

Food Service – Commercial Electric Griddle

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® griddle. ENERGY STAR® griddles save energy cooking and idle times due to improved cooking efficiency and idle energy rates.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = (SAVE)(Width)(Hours)$$
$$\Delta kW = (SAVE)(Width)$$

Where:

ΔkWh	=	gross annual kWh savings from the measure. With default Width, average savings are 1,637 kWh.
ΔkW	=	gross average kW savings from the measure. With default Width, average savings are 0.44 kW.
SAVE	=	Savings per foot of griddle width: 0.15 kW/ft[594]
Width	=	Width of griddle in feet. Default of 3 feet.
Hours	=	Average annual equipment operating hours, see Hours section below.

Baseline Efficiency

The baseline efficiency case is a typically sized, 6 sq. ft. commercial griddle with a cooking energy efficiency of 65%, production capacity of 35 pounds per hour, and idle energy rate of 400 W/sq. ft.

594 Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Griddle Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015.

High Efficiency

The high efficiency case is a typically sized, 6 sq. ft. commercial griddle with a cooking energy efficiency of 70%, production capacity of 40 pounds per hour, and idle energy rate of 320 W/sq. ft.

Hours

Griddles are assumed to operate 313 days per year.[595] The average griddle is assumed to operate 12 hours per day[596], or 3,756 hours per year.

Measure Life

The measure life for a new griddle is 12 years.[597]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Electric Griddle	NB, EUL	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

595 The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr

Food Service – Low Temperature Commercial Dishwasher

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® low temperature commercial dishwasher in a facility with electric hot water heating. Low temperature dishwashers use the hot water supplied by the kitchen's existing water heater and use a chemical sanitizing agent in the final rinse cycle and sometimes a drying agent.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Water
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cleaning Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = \Delta kWh$$
$$\Delta kW = \Delta kWh / Hours$$

Where:
ΔkWh = gross annual kWh savings from the measure. See table below.
ΔkW = gross average kW savings from the measure. See table below.
Hours = Average annual equipment operating hours, see Hours section below.

Energy Savings for Low Temperature Commercial Dishwashers[598]

Equipment Type	ΔkW	ΔkWh
Under Counter	0.39	2,178
Door Type	2.46	13,851
Single Tank Conveyor	2.07	11,685
Multi Tank Conveyor	2.86	16,131

598 Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Dishwasher Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015. Default values used except for days operated per year. See Hours section below.

Baseline Efficiency

The baseline efficiency case is a commercial dishwasher with idle energy rates and water consumption as follows:

Dishwasher Type	Idle Energy Rate (kW)	Water Consumption (gal/rack)
Under Counter	0.50	1.73
Door Type	0.60	2.10
Single Tank Conveyor	1.60	1.31
Multi Tank Conveyor	2.00	1.04

High Efficiency

The high efficiency case is a commercial dishwasher with idle energy rates and water consumption following ENERGY STAR efficiency requirements as follows:

Dishwasher Type	Max Idle Energy Rate (kW)	Max Water Consumption (gal/rack)
Under Counter	0.50	1.19
Door Type	0.60	1.18
Single Tank Conveyor	1.60	0.79
Multi Tank Conveyor	2.00	0.54

Hours

Dishwashers are assumed to operate 313 days per year.[599] The average dishwasher is assumed to operate 18 hours per day[600], or 5,634 hours per year.

Measure Life

The measure life for a new low temperature dishwasher is given by type below:[601]

Dishwasher Type	Life (years)
Under Counter	10
Door Type	15
Single or Multi Tank Conveyor	20

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

[599] The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr
[600] Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Dishwasher Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015.
[601] Ibid.

Non-Energy Impacts

There are water savings associated with this measure:[602]

Dishwasher Type	Annual water savings (Gal/Unit)	Annual wastewater savings per unit (Gal/Unit)
Under Counter	12,677	12,677
Door Type	80,629	80,629
Single Tank Conveyor	65,104	65,104
Multi Tank Conveyor	93,900	93,900

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Low Temperature Dishwasher	NB, EUL	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

602 Ibid.

Food Service – High Temperature Commercial Dishwasher

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® high temperature commercial dishwasher in a building with gas domestic hot water. High temperature dishwashers use a booster heater to raise the rinse water temperature to 180^0 F – hot enough to sterilize dishes and assist in drying. Electric savings are achieved through savings to the electric booster.
Primary Energy Impact: Electric
Secondary Energy Impact: Gas
Non-Energy Impact: Water
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cleaning Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = \Delta kWh$$

$$\Delta kW = \Delta kWh / Hours$$

Where:

ΔkWh = gross annual kWh savings from the measure. See table below
ΔkW = gross average kW savings from the measure. See table below
Hours = Average annual equipment operating hours, see Hours section below.

Energy Savings for High Temperature Commercial Dishwashers[603]

Equipment Type	ΔkW	ΔkWh
Under Counter	0.32	1,791
Door Type	0.74	4,151
Single Tank Conveyor	0.75	4,243
Multi Tank Conveyor	1.71	9,630
Pot, Pan, and Utensil	0.18	1,032

[603] Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Dishwasher Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015. Default values used except for days operated per year. See Hours section below.

Baseline Efficiency

The baseline efficiency case is a commercial dishwasher with idle energy rates and water consumption as follows:

Dishwasher Type	Idle Energy Rate (kW)	Water Consumption (gal/rack)
Under Counter	0.76	1.09
Door Type	0.87	1.29
Single Tank Conveyor	1.93	0.87
Multi Tank Conveyor	2.59	0.97
Pot, Pan, and Utensil	1.20	0.70

High Efficiency

The high efficiency case is a commercial dishwasher with idle energy rates and water consumption following ENERGY STAR® Efficiency Requirements as follows:

Dishwasher Type	Idle Energy Rate (kW)	Water Consumption (gal/rack)
Under Counter	0.50	0.86
Door Type	0.70	0.89
Single Tank Conveyor	1.50	0.70
Multi Tank Conveyor	2.25	0.54
Pot, Pan, and Utensil	1.20	0.58

Hours

Dishwashers are assumed to operate 313 days per year.[604] The average dishwasher is assumed to operate 18 hours per day[605], or 5,634 hours per year.

Measure Life

The measure life for a new high temperature dishwasher is given by type below:[606]

Dishwasher Type	Life (years)
Under Counter	10
Door Type	15
Single or Multi Tank Conveyor	20
Pot, Pan, and Utensil	10

[604] The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr

High Temperature Dishwasher	NB, EUL	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

[607] Ibid.

Food Service – Commercial Ice Machine

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® commercial ice machine. Commercial ice machines meeting the ENERGY STAR® specifications are on average 15 percent more energy efficient and 10 percent more water-efficient than standard models. ENERGY STAR® qualified equipment includes ice-making head (IMH), self-contained (SCU), and remote condensing units (RCU).
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: Water
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Ice Machines
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = \Delta kWh$$

$$\Delta kW = \Delta kWh / Hours$$

Where:
ΔkWh = gross annual kWh savings from the measure. See table below.
ΔkW = gross average kW savings from the measure. See table below.
Hours = Average annual equipment operating hours, see Hours section below.

Energy Savings for Commercial Ice Machine[608]

Equipment Type	ΔkW	ΔkWh
Ice Making Head	0.08	665
Self Contained Unit	0.02	205
Remote Condensing Unit (Batch)	0.07	630
Remote Condensing Unit (Continuous)	0.14	1,196

[608] Savings Calculator for ENERGY STAR® Certified Commercial Kitchen Equipment: Ice Machine Calcs. < http://www.energystar.gov/buildings/sites/default/uploads/files/commercial_kitchen_equipment_calculator.xlsx >. Tool downloaded August 10, 2015. Except for duty cycle of machines- ES tool uses 75% duty cycle, which is thought to be too high. Duty cycle of 40% used instead.

Baseline Efficiency

The baseline efficiency case is a non-ENERGY STAR® commercial ice machine.

High Efficiency

The high efficiency case is a commercial ice machine meeting the ENERGY STAR® Efficiency Requirements.

Hours

Ice making machines are assumed to operate 365 days per year. The average ice making machine is assumed to operate 18 hours per day[609], or 5,634 hours per year.

Measure Life

The measure life for a new ice making machine is assumed to be 8 years.[610]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There is water savings associated with this measure:[611]

Dishwasher Type	Annual water savings (gal/unit)	Annual wastewater savings (gal/unit)
Ice Making Head	3,322	3,322
Self Contained Unit	3,526	3,526
Remote Condensing Unit (Batch)	2,631	2,631
Remote Condensing Unit (Continuous)	0	0

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Ice Making Machine	NB, EUL	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

Food Service – Commercial Fryers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® standard or large vat commercial fryer. ENERGY STAR® commercial fryers save energy during cooking and idle times due to improved cooking efficiency and idle energy rates.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = \Delta kWh$$
$$\Delta kW = \Delta kW / Hours$$

Where:
ΔkWh = gross annual kWh savings from the measure per table below
ΔkW = gross average kW savings from the measure per table below
Hours = Annual hours of operation. See Hours section below.

Energy Savings for Commercial Fryer[612]

Equipment Type	ΔkW	ΔkWh
Standard Vat	0.16	610
Large Vat	0.58	2,175

Baseline Efficiency

The baseline efficiency case for a standard sized fryer is a deep-fat fryer with a cooking energy efficiency of 75%, shortening capacity of up to 65 pounds, and idle energy rate of 1.05 kW.

[612] ENERGY STAR® Commercial Kitchen Equipment Savings Calculator: Fryer Calcs. < http://www.energystar.gov/ia/business/bulk_purchasing/bpsavings_calc/commercial_kitchen_equipment_calculator.xls>. Tool downloaded August 10, 2015. Default assumptions used except for operating hours, see Hours section, and food cooked per day. Standard sized fryer food cooked per day reduced by 25% to 112 lb/day reflect the 25% reduction in operating hours

The baseline efficiency case for a large sized fryer is a deep-fat fryer with a cooking energy efficiency of 70%, shortening capacity of up to 100 pounds, and idle energy rate of 1.35 kW.

High Efficiency

The high efficiency case for a standard sized fryer is a deep-fat fryer with a cooking energy efficiency of 80%, shortening capacity of up to 70 pounds, and idle energy rate of no more than 1.0 kW. For large-capacity fryers (shortening capacity exceeds 70 pounds), the idle energy rate may be up to 1.1 kW.

Hours

Fryers assumed to operate 313 days per year.[613] Fryers assumed to operate 12 hours a day, or 3,756 hours per year.[614]

Measure Life

The measure life for a new commercial electric fryer is 12 years[615].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	SPF	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Electric Fryer	NB, EUL	All	1.00	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

[613] The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr
[614] Default hours of 16 seem excessive by staff estimates and compared to other commercial equipment operation hours. Twelve hours used as more reasonable estimate.

Food Service – Food Holding Cabinets

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a qualified ENERGY STAR® hot food holding cabinet (HFHC). ENERGY STAR® hot food holding cabinets are 70 percent more energy efficient than standard models. Models that meet this requirement incorporate better insulation, reducing heat loss, and may also offer additional energy saving devices such as magnetic door gaskets, auto-door closures, or dutch doors. The insulation of the cabinet also offers better temperature uniformity within the cabinet from top to bottom. Offering full size, ¾ size, and ½ half size HFHC.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Storage Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

Unit savings are deemed based on the Energy Star Commercial Kitchen Equipment Savings Calculator:

$$\Delta kWh = \Delta kWh$$
$$\Delta kW = \Delta kWh / Hours$$

Where:
ΔkWh = gross annual kWh savings from the measure: See table below.
ΔkW = gross average kW savings from the measure: See table below.
Hours = Annual hours of operation. See Hours section below.

Energy Savings for Commercial Hot Food Holding Cabinets[616]

Equipment Type	ΔkW	ΔkWh
Full Size – 20 ft^3	0.51	2,376
¾ Size – 12 ft^3	0.22	1,042
½ Size – 8 ft^3	0.15	695

[616] ENERGY STAR® Commercial Kitchen Equipment Savings Calculator: HFHC Calcs. < http://www.energystar.gov/ia/business/bulk_purchasing/bpsavings_calc/commercial_kitchen_equipment_calculator.xls>. Tool downloaded August 10, 2015. Default assumptions used except for hours of operation and volume of HFHC. See Hours section below.

Baseline Efficiency

The baseline efficiency idle energy rate for a HFHC is 40 W for all sizes.

High Efficiency

The high efficiency idle energy rate for HFHC is 294 W for full size, 258 W for ¾ size, and 172 W for ½ size.

Hours

Hot food holding cabinets assumed to operate 313 days per year[617] for 15 hours a day, or 4,695 hours per year.[618]

Measure Life

The measure life for a new commercial HFHC is 12 years[619].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	SPF	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
HFHC	NB, EUL	All	1.00	1.00	1.00	1.00	1.00	0.90	0.90

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
100% realization rates are assumed because savings are based on researched assumptions by ENERGY STAR®.

Coincidence Factors
Coincidence factors are 0.9 for both summer and winter seasons to account for the fact that some restaurants close one day per week and some may not serve both lunch and dinner on weekdays.

[617] The default value of 365 days per year seems excessive. Though many or most restaurants operate 7 days per week, many institutional kitchens do not. 6 day operation is assumed. 365 * 6/7 = 313 days/yr
[618] Default hours of 16 seem excessive by staff estimates and compared to other commercial equipment operation hours. Twelve hours used as more reasonable estimate.
[619] Pacific Gas & Electric Company – Customer Energy Efficiency Department (2007). *Work Paper PGECOFST101, Commercial Convection Oven, Revision #0.*

Compressed Air – High Efficiency Air Compressors

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Covers the installation of oil flooded, rotary screw compressors with Load/No Load, Variable Speed Drive, or Variable Displacement capacity control with properly sized air receiver. Efficient air compressors use various control schemes to improve compression efficiencies at partial loads. When an air compressor fitted with Load/No Load, Variable Speed Drive, or Variable Displacement capacity controls is used in conjunction with a properly-sized air receiver, considerable amounts of energy can be saved.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: Compressed Air
Measure Type: Air Compressors
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (HP_{COMPRESSOR})(SAVE)(Hours)$$
$$\Delta kW = (HP_{COMPRESSOR})(SAVE)$$

Where:

$HP_{COMPRESSOR}$	=	Nominal rated horsepower of high efficiency air compressor.
Save	=	Air compressor kW reduction per HP: 0.189. [620]
Hours	=	Annual operating hours of the air compressor.

Baseline Efficiency

The baseline efficiency case is a typical load/unload compressor.

High Efficiency

The high efficient case is an oil-flooded, rotary screw compressor with Variable Speed Drive or Variable Displacement capacity control with a properly sized air receiver. Air receivers are designed to provide a supply buffer to meet short-term demand spikes which can exceed the compressor capacity. Installing a larger receiver tank to meet occasional peak demands can allow for the use of a smaller compressor.

[620] DNV GL (2015). Impact Evaluation of Prescriptive Chiller and Compressed Air Installations. Prepared for the MA PAs and EEAC. Result for VSD 25-75 HP used since "All" result includes savings from load/unload compressors, which are now baseline.

Hours

The annual hours of operation for air compressors are site-specific and should be determined on a case-by-case basis.

Measure Life

For lost-opportunity installations, the lifetime for this measure is 15 years.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Air Compressor	NB, EUL, Large Retrofit	All	1.00	1.39	1.00	1.00	1.17	0.98	1.29	1.00

In-Service Rates
All installations have 100% in service rate since PA programs include verification of equipment installations.

Realization Rates

- All PAs: RR from the prospective results of the 2015 study of prescriptive compressed air. The RR adjusts for differences in operating hours between PA tracking assumptions and on site findings. The RR must be coupled with the updated kW/HP results from the same study.[621]

Coincidence Factors

- All PAs: CFs from the prospective results of the 2015 study of prescriptive compressed air.[622]

[621] DNV GL (2015). *Impact Evaluation of Prescriptive Chiller and Compressed Air Installations*. Prepared for the MA PAs and EEAC.
[622] Ibid.

Compressed Air – Refrigerated Air Dryers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of cycling or variable frequency drive (VFD)-equipped refrigerated compressed air dryers. Refrigerated air dryers remove the moisture from a compressed air system to enhance overall system performance. An efficient refrigerated dryer cycles on and off or uses a variable speed drive as required by the demand for compressed air instead of running continuously. Only properly sized refrigerated air dryers used in a single-compressor system are eligible.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Compressed Air
Measure Type: Refrigerated Air Dryers
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = (CFM_{DRYER})(SAVE)(Hours)$$
$$\Delta kW = (CFM_{DRYER})(SAVE)$$

Where:

CFM_{DRYER}	=	Full flow rated capacity of the refrigerated air dryer in cubic feet per minute (CFM). Obtain from equipment's Compressed Air Gas Institute Datasheet.
Save	=	Refrigerated air dryer kW reduction per dryer full flow rated CFM: 0.00554. [623]
Hours	=	Annual operating hours of the refrigerated air dryer.

Baseline Efficiency

The baseline efficiency case is a non-cycling refrigerated air dryer.

High Efficiency

The high efficiency case is a cycling refrigerated dryer or a refrigerated dryer equipped with a VFD.

[623] DNV GL (2015). *Impact Evaluation of Prescriptive Chiller and Compressed Air Installations*. Prepared for the MA PAs and EEAC.

Hours

The annual hours of operation for compressed air dryers are site-specific.

Measure Life

The measure life is 15 years.[624]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Refrigerated Air Dryers	NB, EUL	All	1.00	1.56	1.00	1.00	1.17	0.98	1.29	1.00

<u>In-Service Rates</u>
All installations have 100% in service rate since PA programs include verification of equipment installations.

<u>Realization Rates</u>
RR from the prospective results of the 2015 study of prescriptive compressed air. The RR adjusts for differences in operating hours between PA tracking assumptions and on site findings. The RR must be coupled with the updated kW/CFM results from the same study.[625]

<u>Coincidence Factors</u>
CFs from the prospective results of the 2015 study of prescriptive compressed air.[626]

Compressed Air – Low Pressure Drop Filters

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Filters remove solids and aerosols from compressed air systems. Low pressure drop filters have longer lives and lower pressure drops than traditional coalescing filters resulting in higher efficiencies.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity & Retrofit
End Use: Compressed Air
Measure Type: Low Pressure Drop Filters
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impacts[627]

$$\Delta kWh = (Quantity)(HP_{COMP})(0.7457)(\%Savings)(Hours)$$
$$\Delta kW = (Quantity)(HP_{COMP})(0.7457)(\%Savings)$$

Where:

ΔkWh	=	Energy savings
ΔkW	=	Demand savings
Quantity	=	Number of filters installed
HP_{COMP}	=	Average compressor load
0.7457	=	Conversion from HP to kW
% Savings	=	Percent change in pressure drop. Site specific.
Hours	=	Annual operating hours of the lower pressure drop filter.

Baseline Efficiency

The baseline efficiency case is a standard coalescing filter with initial drop of between 1 and 2 pounds per sq inch (psi) with an end of life drop of 10 psi.

High Efficiency

The high efficiency case is a low pressure drop filter with initial drop not exceeding 1 psi over life and 3 psi at element change. Filters must be deep-bed, “mist eliminator” style and installed on a single operating compressor rated 15 – 75 HP.

[627] Formula adapted from savings calculation tool developed by Lenticular Solutions Inc.

Hours

The annual hours of operation are site specific and will be determined on a case by case basis.

Measure Life

For lost-opportunity installations, the lifetime for this measure is 5 years. For retrofit projects, the lifetime is 3 years.[628]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings[629]

Compressed Air – Zero Loss Condensate Drains

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Drains remove water from a compressed air system. Zero loss condensate drains remove water from a compressed air system without venting any air, resulting in less air demand and consequently greater efficiency.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity & Retrofit
End Use: Compressed Air
Measure Type: Zero Loss Condensate Drains
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (CFM_{pipe})(CFM_{saved})(SAVE)(Hours)$$
$$\Delta kW = (CFM_{pipe})(CFM_{save})(SAVE)$$

Where:

ΔkWh	=	Energy Savings
ΔkW	=	Demand savings
CFM_{pipe}	=	CFM capacity of piping. Site specific.
CFM_{saved}	=	Average CFM saved per CFM of piping capacity: 0.049
Save	=	Average savings per CFM: 0.24386 kW/CFM[634]
Hours	=	Annual operating hours of the zero loss condensate drain.

Baseline Efficiency

The baseline efficiency case is installation of a standard condensate drain on a compressor system.

High Efficiency

The high efficiency case is installation of a zero loss condensate drain on a single operating compressor rated ≤ 75 HP.

Hours

The annual hours of operation are site specific and will be determined on a case by case basis.

[634] Based on Eversource (NSTAR) analysis assuming a typical timed drain settings discharge scenario.

Measure Life

For lost-opportunity installations, the lifetime for this measure is 15 years. For retrofit projects, the lifetime is 13 years.[635]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings[636]

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CFSSP	CFWSP
Zero Loss Drain	NB, EUL, Large Retrofit	National Grid	1.00	1.00	1.00	1.00	0.80	0.54	0.77	0.54
Zero Loss Drain	NB, EUL, Large Retrofit	Eversource (NSTAR), CLC	1.00	1.25	0.95	0.80	0.88	0.69	n/a	n/a

Motors/Drives – Variable Frequency Drives

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure covers the installation of variable speed drives according to the terms and conditions stated on the statewide worksheet. The measure covers multiple end use types and building types. The installation of this measure saves energy since the power required to rotate a pump or fan at lower speeds requires less power than when rotated at full speed.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: Motors/Drives
Measure Type: Variable Speed Drive
Core Initiative: C&I New Buildings & Major Renovations and C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (HP)\left(\frac{1}{\eta_{motor}}\right)(kWh / HP)$$

$$\Delta kW = (HP)\left(\frac{1}{\eta_{motor}}\right)(kW / HP)_{SP}$$

Where:

HP	=	Rated horsepower for the impacted motor.
η_{motor}	=	Motor efficiency
kWh/HP	=	Annual electric energy reduction based on building and equipment type. See table below.
kW/HP_{SP}	=	Summer demand reduction based on building and equipment type. See table below.
kW/HP_{WP}	=	Winter demand reduction based on building and equipment type. See table below.

Savings Factors for C&I VFDs (kWh/HP[641] and kW/HP[642])

Loop: kW/HP estimates derived from Cadmus (2012). *Variable Speed Drive Loadshape Project.* Prepared for the NEEP Regional Evaluation, Measurement & Verification Forum. Other drive type kW/HP savings estimates based on Chan, Tumin (2010). *Formulation of a Prescriptive Incentive for the VFD and Motors & VFD impact tables at NSTAR*. Prepared for NSTAR.

Baseline Efficiency

The baseline efficiency case measure varies with equipment type. All baselines assume either a constant or 2-speed motor. Air or water volume/temperature is controlled using valves, dampers, and/or reheats.

High Efficiency

In the high efficiency case, pump flow or fan air volume is directly controlled using downstream information. The pump or fan will automatically adjust its speed based on inputted set points and the downstream feedback it receives.

Hours

Hours vary by end use and building type.

Measure Life

For lost-opportunity installations, the lifetime is 15 years. For retrofit projects, the lifetime is 13 years.[643]

Secondary Energy Impacts

There are no secondary energy impacts.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
VFD	NB, EUL	All	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Large Retrofit	All	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	CLC	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	Eversource (NSTAR)	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	Eversource (WMECO)	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Energy RRs for all PAs based on impact evaluation of 2011-2012 prescriptive VSD projects.[644] Demand RRs from study not used due to low precision of demand results. Demand RRs for Chilled Water Pump, Hot Water Circ. Pump, Return Fan, Supply Fan, and WSHP Circ. Loop set to 1 since savings based on NEEP VSD Loadshape study.

Coincidence Factors
CFs for all PAs set to 1.0 since summer and winter demand savings are based on evaluation results.

[644] KEMA, Inc. and DMI, Inc. (2013). *2011-2012 Massachusetts Prescriptive VSD Impact Evaluation.* Prepared for the Massachusetts Program Administrators and the Massachusetts Energy Efficiency Advisory Council.

Motors/Drives – Motor and Variable Frequency Drives

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure covers the installation of a high efficiency motor with a variable speed drives according to the terms and conditions stated on the statewide worksheet. The measure covers multiple end use types and building types. The installation of this measure saves energy since the power required to rotate a pump or fan at lower speeds requires less power than when rotated at full speed.
Primary Energy Impact: Electric
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: Motors/Drives
Measure Type: Variable Speed Drive
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impacts

$$\Delta kWh = (HP)\left(\frac{1}{\eta_{motor}}\right)(kWh/HP)$$

$$\Delta kW = (HP)\left(\frac{1}{\eta_{motor}}\right)(kW/HP)_{SP}$$

Where:

HP	=	Rated horsepower for the impacted motor.
η_{motor}	=	Motor efficiency
kWh/HP	=	Annual electric energy reduction based on building and equipment type. See table below.
kW/HP_{SP}	=	Summer demand reduction based on building and equipment type. See table below.
kW/HP_{WP}	=	Winter demand reduction based on building and equipment type. See table below.

Savings Factors for C&I VFDs with Motor Replacement (kWh/HP[645] and kW/HP[646])

	Building Exhaust Fan	Cooling Tower Fan	Chilled Water Pump	Boiler Feed Water Pump	Hot Water Circulating. Pump	MAF - Make-up Air Fan	Return Fan	Supply Fan	WS Heat Pump Circulating Loop

Baseline Efficiency

In the baselines, air or water volume/temperature is controlled using valves, dampers, and/or reheats.

645 Chan, Tumin (2010). *Formulation of a Prescriptive Incentive for the VFD and Motors & VFD impact tables at Eversource (NSTAR)*. Prepared for NSTAR.
646 For Chilled Water Pump, Hot Water Circ. Pump, Return Fan, Supply Fan, and WSHP Circ. Loop: kW/HP estimates derived from Cadmus (2012). *Variable Speed Drive Loadshape Project.* Prepared for the NEEP Regional Evaluation, Measurement & Verification Forum. Other drive type kW/HP savings estimates based on Chan, Tumin (2010). *Formulation of a Prescriptive Incentive for the VFD and Motors & VFD impact tables at NSTAR*. Prepared for NSTAR.

High Efficiency

In the high efficiency case, pump flow or fan air volume is directly controlled using downstream information. The pump or fan will automatically adjust its speed based on inputted set points and the downstream feedback it receives.

Hours

Hours vary by end use and building type.

Measure Life

For retrofit projects, the lifetime is 13 years.[647]

Secondary Energy Impacts

There are no secondary energy impacts.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
VFD	Large Retrofit	All	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	CLC	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	Eversource (NSTAR)	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00
VFD	Small Retrofit	Eversource (WMECO)	1.00	0.94	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
All installations have 100% in service rate since all PAs programs include verification of equipment installations.

Realization Rates
Energy RRs for all PAs based on impact evaluation of 2011-2012 prescriptive VSD projects.[648] Demand RRs from study not used due to low precision of demand results. Demand RRs for Chilled Water Pump, Hot Water Circ. Pump, Return Fan, Supply Fan, and WSHP Circ. Loop set to 1 since savings based on NEEP VSD Loadshape study.

Coincidence Factors
CFs for all PAs set to 1.0 since summer and winter demand savings are based on evaluation results.

[647] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-1.
[648] KEMA, Inc. and DMI, Inc. (2013). *2011-2012 Massachusetts Prescriptive VSD Impact Evaluation.* Prepared for the Massachusetts Program Administrators and the Massachusetts Energy Efficiency Advisory Council.

Whole Building - Building Operator Certification

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Building Operator Certification (BOC) is a nationally recognized training program designed to educate facilities personnel in the energy and resource efficient operation and maintenance of building systems. Savings include only operations, maintenance and controls savings.
Primary Energy Impact: Electric
Secondary Energy Impact: Project Specific
Non-Energy Impact: Project Specific
Sector: Commercial & Industrial
Market: Retrofit
End Use: All
Measure Type: Custom
Core Initiative: C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

Savings are deemed based on study results[649]

Savings for Building Operator Certification

Measure Name	ΔkWh/SF/Student
BOC – O&M Only	0.178
BOC – O&M plus Capital Upgrades	0.364

Baseline Efficiency

No BOC training

High Efficiency

Completion and certification in a BOC level I or level II training course.

Measure Life

Measure life of 5 years.[650]

Secondary Energy Impacts

There are no secondary energy impacts.

[649] Navigant Consulting (2015). *Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification.* Prepared for the Massachusetts Program Administrators and the Energy Efficiency Advisory Council
[650] Ibid.

Non-Energy Impacts

There are no non-energy impacts for this measure.

BOC Training	Large Retrofit	National Grid	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
n/a

Realization Rates
Realization rates are set to 100% since savings are based off of evaluation results.

Coincidence Factors
Coincident factors are set to 1.0.

Code Compliance Support Initiative (CCSI) - Commercial

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The MassSave Code Compliance Support Initiative (CCSI) is focused on improving the energy code compliance rates of residential and commercial buildings in the state. The initiative includes trainings, technical support, and the development of compliance documentation tools. This effort will support code officials, as well as design and construction professionals.
Primary Energy Impact: Electric & Gas
Secondary Energy Impact: N/A
Non-Energy Impact: N/A
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: All
Measure Type: Whole Building
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

$$\Delta kWh = GTP * \frac{(1 - NC) - BC}{1 - BC} * AF * ARF$$

Where:

GTP = Gross Technical Potential - Commercial energy savings (kWh and Therms) through building simulations described below under Baseline Efficiency. The gross technical potential for C&I is the difference between site observed energy measures and buildings modelled as 100% compliant with 2012 IECC requirements multiplied by the total square feet of new commercial buildings in MA

NC = Non-Compliance - The percentage of potential energy savings not realized at the end of an energy code cycle due to buildings on average not fully meeting code requirements: the difference between 100% and actual compliance at the end of the energy code cycle

BC = Baseline Compliance - The percentage of energy savings realized at the beginning of a new code cycle

AF = Attribution Factor - The percentage of potential energy savings above the normal compliance level, on average, at the end of a typical energy code cycle attributable to PA CCSI efforts[651]

ARF = Annual Ramp Factor - Factor used to simulate how quickly the CCSI reaches the target compliance goal across years. That is, since it takes time for the education efforts of the CCSI to take hold only a portion of the attributable savings are claimed each year during the

[651] A deemed rate of 35% is used.

initiative and ramped up to 100% over the entire three year term[652]

Baseline Efficiency

The baseline efficiency case assumes energy consumption using a measured compliance level[653]. The baseline for the commercial building sector was determined as buildings that meet 100% of the 2012 IECC code, and were then compared to non-compliant buildings that were surveyed during the 2012 code baseline study[654] (commercial buildings on average were 80% compliant with the 2006/2009 codes at the time of the study in terms of energy savings). New Buildings Institute conducted building modeling simulations for five building types based on data collected during the 2012 code baseline study. Energy Use Intensities (EUI) for offices, schools, multifamily, retail and refrigerated warehouses were created both for 100% compliant conditions and for those when compliance was not met. The EUIs were then multiplied by the forecasted number of square feet of new construction commercial buildings in MA using the online Dodge Database.

High Efficiency

The high efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code.

Hours

Not Applicable.

Measure Life

20 years.

Secondary Energy Impacts

Not Applicable.

Non-Energy Impacts

Not Applicable.

Impact Factors for Calculating Adjusted Gross Savings

Measure	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Code Compliance Support Initiative	ALL	1.00	1.00	1.00	1.00	N/A	N/A	N/A	N/A

Note: Unless otherwise stated, PA's use Statewide results.

[652] The 2016 – 2018 term includes savings from 2015 – 2018 where the Annual Ramp Factor is 20% for 2015, 30% for 2016, 50% for 2017, and 100% for 2018.
[653] DNV-GL, ERS, APPRISE (2015). *Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study, Final Report,* Prepared for: Massachusetts Program Administrators and Energy Efficiency Advisory Council.
[654] DNV-KEMA, ERS, APPRISE (2012). *Final Report, Project 11, Code Compliance Baseline Study*, Prepared for: Massachusetts Energy Efficiency Program Administrators.

In-Service Rates
All PAs use 100% in service rate.

Savings Persistence Factor
All PAs use 100% savings persistence factor.

Realization Rates
All PAs use 100% realization rates as all adjustments are made via the factors listed in the algorithm above.

Coincidence Factors
Not applicable as only energy savings are counted.

Custom Measures (Large C&I)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The Custom project track is offered for energy efficiency projects involving complex site-specific applications that require detailed engineering analysis and/or projects which do not qualify for incentives under any of the prescriptive rebate offering. Projects offered through the custom approach must pass a cost-effectiveness test based on project-specific costs and savings.
Primary Energy Impact: Electric
Secondary Energy Impact: Project Specific
Non-Energy Impact: Project Specific
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: All
Measure Type: Custom
Core Initiative: C&I New Buildings & Major Renovations and C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit

Notes

In 2011 the PAs agreed on the following set of categories for Large C&I custom projects. All Large C&I Custom projects will be assigned to one of the following categories for future statewide impact evaluation.

Custom Category	Description
Comprehensive Design	New construction projects which address multiple end-uses, reach 20%+ total energy savings, and use whole-building simulations for ex-ante savings estimates and Retrofit projects which address multiple end-uses, reach 15%+ electric energy savings, and do not require whole-building simulations.
Compressed Air	New construction and/or retrofit projects for compressed air systems.
CHP	Combined Heat and Power projects.
HVAC	New construction and/or retrofit projects for HVAC system equipment and controls.
Lighting	New construction and/or retrofit projects for lighting system equipment and controls.
Motor	New construction and/or retrofit projects for motor installations or controls.
Other	New construction and/or retrofit projects that do not fit in with other categories.
Process	New construction and/or retrofit projects for process system equipment and controls.
Refrigeration	New construction and/or retrofit projects for refrigeration system equipment and controls.
Verified Savings	Retrofit “Pay-for-Performance” projects for which savings are estimated based on post-installation measurement and verification.

Algorithms for Calculating Primary Energy Impact

Gross energy and demand savings estimates for custom projects are calculated using engineering analysis with project-specific details. Custom analyses typically include a weather dependent load bin analysis, whole building energy model simulation, end-use metering or other engineering analysis and include estimates of savings, costs, and an evaluation of the projects' cost-effectiveness.

Baseline Efficiency

For lost opportunity projects, the baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code or industry accepted standard practice. For retrofit projects, the baseline efficiency case is the same as the existing, or pre-retrofit, case for the facility.

High Efficiency

The high efficiency scenario is specific to the custom project and may include one or more energy efficiency measures. Energy and demand savings calculations are based on projected or measured changes in equipment efficiencies and operating characteristics and are determined on a case-by-case basis. The project must be proven cost-effective in order to qualify for energy efficiency incentives.

Hours

All hours for custom savings analyses should be determined on a case-by-case basis.

Measure Life

For both lost-opportunity and retrofit custom applications, the measure life is determined based on specific project using the common custom measure life recommendations.[655]

Secondary Energy Impacts

All secondary energy impacts should be determined on a case-by-case basis.

Non-Energy Impacts

All non-energy impacts should be determined on a case-by-case basis.

[655] Energy & Resource Solutions (2005). *Measure Life Study*. Prepared for The Massachusetts Joint Utilities; Table 1-2.

Verified Savings[656]	Statewide	1.00	1.00	1.00	1.00	custom	custom	custom	custom

Note: Unless otherwise stated, PA's use Statewide results.

[656] The PAs assume 100% realization rates for verified savings projects because gross savings assumptions are based on post-installation verification and analysis. This custom category is new in 2011 and has not been evaluated.

In-Service Rates

All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates

- Comprehensive: Realization rates from statewide impact evaluation completed in 2011. National Grid uses PA specific values, all other PA's use statewide values due to small sample size. [657]
- HVAC: Realization rates from statewide impact evaluation completed in 2015. National Grid and Eversource (NSTAR) use PA specific values, all other PA's use statewide values due to small sample size.[658]
- CHP: National Grid, Eversource (NSTAR) and Unitil CHP RRs from a Massachusetts CHP impact evaluation of 2011-2012 CHP projects.[659]
- Compressed Air: Realization rates from statewide impact evaluation completed in 2012.[660] All PA's use statewide values due to poor precision on a PA level.
- Process: Realization rates from statewide impact evaluation completed in 2012.[661] National Grid and Eversource (NSTAR) use PA specific values, all other PA's use statewide values due to small sample size.
- Lighting: Realization rates from statewide impact evaluation completed in 2012.[662] National Grid and Eversource (NSTAR) use PA specific values, all other PA's use statewide values due to small sample size.
- Refrigeration, Motors, and Other: Realization rates from statewide impact evaluation completed in 2012. National Grid uses PA specific values for each end use, All other PAs use statewide values due to small sample size. In the case of Eversource (NSTAR), the statewide rate for Custom Motors was used due to small sample size and the PA specific number for Refrigeration.[663]

Coincidence Factors

For all PAs, gross summer and winter peak coincidence factors are custom-calculated for each custom project based on project-specific information. The actual or measured coincidence factors are included in the summer and winter demand realization rates.

Custom Measures (Small C&I)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The Custom project track is offered for energy efficiency projects involving complex site-specific applications that require detailed engineering analysis and/or projects which do not qualify for incentives under any of the prescriptive rebate offering. Projects offered through the custom approach must pass a cost-effectiveness test based on project-specific costs and savings.
Primary Energy Impact: Electric
Secondary Energy Impact: Project Specific
Non-Energy Impact: Project Specific
Sector: Commercial & Industrial
Market: Retrofit
End Use: All
Measure Type: Custom
Core Initiative: C&I Small Business

Algorithms for Calculating Primary Energy Impact

Gross energy and demand savings estimates for custom projects are calculated using engineering analysis with project-specific details. Custom analyses typically include a weather dependent load bin analysis, whole building energy model simulation, end-use metering or other engineering analysis and include estimates of savings, costs, and an evaluation of the projects' cost-effectiveness.

Baseline Efficiency

For Lost Opportunity projects, the baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code or industry accepted standard practice. For retrofit projects, the baseline efficiency case is the same as the existing, or pre-retrofit, case for the facility.

High Efficiency

The high efficiency scenario is specific to the custom project and may include one or more energy efficiency measures. Energy and demand savings calculations are based on projected or measured changes in equipment efficiencies and operating characteristics and are determined on a case-by-case basis. The project must be proven cost-effective in order to qualify for energy efficiency incentives.

Hours

All hours for custom savings analyses should be determined on a case-by-case basis.

Measure Life

For both lost-opportunity and retrofit custom applications, the measure life is determined based on specific project using the common custom measure life recommendations.[664]

Secondary Energy Impacts

All secondary energy impacts should be determined on a case-by-case basis.

Non-Energy Impacts

All non-energy impacts should be determined on a case-by-case basis.

Custom Measures (Multifamily C&I)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Vendors install a variety of measures at multifamily facilities. Measures include lighting, HVAC, and domestic hot water equipment and measures.
Primary Energy Impact: Electric
Secondary Energy Impact: Project Specific
Non-Energy Impact: Yes
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC, Lighting, Hot Water
Measure Type: Custom
Core Initiative: C&I Multifamily

Algorithms for Calculating Primary Energy Impact

Gross energy and demand savings estimates for C&I Multifamily projects are calculated by approved vendors with project-specific details. Vendors currently use algorithms (described in the Residential section of this document) to calculate savings.

Baseline Efficiency

For retrofit projects, the baseline efficiency case is the same as the existing, or pre-retrofit, case for the facility.

High Efficiency

The high efficiency scenario is specific to the facility and may include one or more energy efficiency measures. Energy and demand savings calculations are based on projected or measured changes in equipment efficiencies and operating characteristics and are determined on a case-by-case basis.

Hours

See Residential Section of this document.

Measure Life

See Residential Section of this document.

Secondary Energy Impacts

See Residential Section of this document.

Non-Energy Impacts

All non-energy impacts should be determined on a case-by-case basis.

Impact Factors for Calculating Adjusted Gross Savings

Measure	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Lighting	National Grid	1.00	0.98	1.16	0.85	custom	custom	n/a	n/a
	Eversource	1.00	1.02	0.85	0.84	custom	custom	custom	custom
	CLC	1.00	0.98	0.94	0.92	custom	custom	n/a	n/a
	Unitil	1.00	0.98	0.94	0.92	custom	custom	n/a	n/a
HVAC	National Grid	1.00	0.75	0.70	0.67	custom	custom	n/a	n/a
	Eversource	1.00	0.91	0.94	0.88	custom	custom	custom	custom
	CLC	1.00	0.88	0.88	0.85	custom	custom	n/a	n/a
	Unitil	1.00	0.88	0.88	0.85	custom	custom	n/a	n/a
Hot Water	National Grid	1.00	0.68	0.96	0.82	custom	custom	n/a	n/a
	Eversource	1.00	1.00	0.92	0.92	custom	custom	custom	custom
	CLC	1.00	0.91	0.92	0.92	custom	custom	n/a	n/a
	Unitil	1.00	1.08	1.00	1.00	custom	custom	n/a	n/a

In-Service Rates
All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates
- Lighting: All PAs use realization rates from the large commercial custom lighting statewide impact evaluation completed in 2012.[670]
- HVAC: All PAs use realization rates from the large commercial custom HVAC impact evaluation completed in 2015.[671]
- Hot Water: National Grid RRs derived from the large commercial electric process evaluation.[672] Eversource and CLC energy RRs and all demand RRs based on Eversource (NSTAR) 2002–2004 small retrofit impact evaluations, Unitil RRs from Small Business program impact evaluation.[673]

Coincidence Factors
For all PAs, gross summer and winter peak coincidence factors are custom-calculated for each custom project based on project-specific information. The actual or measured coincidence factors are included in the summer and winter demand realization rates.

Prescriptive Measures (C&I Multifamily)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Vendors install a variety of measures at multifamily facilities. Measures include lighting, HVAC, and domestic hot water equipment and measures.
Primary Energy Impact: Electric
Secondary Energy Impact: Project Specific
Non-Energy Impact: Yes
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC, Lighting, Hot Water
Measure Type: Varied, see Residential Section
Core Initiative: C&I Multifamily

Algorithms for Calculating Primary Energy Impact

The prescriptive measures, algorithms, and deemed savings claimed in the C&I Multifamily Retrofit program are identical to those claimed through the Residential Multifamily programs. Please reference the appropriate measure in the residential section of this TRM for all savings algorithms and deemed savings numbers.

Baseline Efficiency

See Residential Section of this document for measure specific detail.

High Efficiency

See Residential Section of this document for measure specific detail.

Hours

See Residential Section of this document for measure specific detail.

Measure Life

See Residential Section of this document for measure specific detail.

Secondary Energy Impacts

See Residential Section of this document for measure specific detail.

Non-Energy Impacts

See Residential Section of this document for measure specific detail.

Impact Factors for Calculating Adjusted Gross Savings

Measure	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}	CF_{SSP}	CF_{WSP}
Lighting	All	0.97	0.60	0.60	0.60	*	*	*	*
HVAC	All	1.00	0.60	0.60	0.60	*	*	*	*
Hot Water	All	1.00	0.60	0.60	0.60	*	*	*	*

In-Service Rates

- Lighting: In Service Rate from the MF Retrofit: MF Retrofit: 2012 MF Impact Analysis[674]
- HVAC and Hot Water: All installations have 100% in service rate since all PA programs include verification of equipment installations.

Realization Rates

- All PAs use realization rates from common assumptions.
- HVAC: National Grid uses realization rates from the All PAs use realization rates from the large commercial custom HVAC impact evaluation completed in 2015. [675]
- Hot Water: National Grid RRs derived from impact evaluation of 2005 SBS program.[676] Eversource and CLC energy RRs and all demand RRs based on NSTAR 2002–2004 small retrofit impact evaluations, Unitil RRs from Small Business program impact evaluation.[677]

Coincidence Factors

Commercial and Industrial Gas Efficiency Measures

Food Service – Commercial Ovens

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of High Efficiency Gas Ovens
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: Water
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed:

Measure Name	ΔMMBtu
Convection Oven	12.9[678]
Combination Oven	112.0 [679]
Conveyer Oven	88.4[680]
Rack Oven	211.3[681]

Baseline Efficiency

The baseline efficiency case is a standard efficiency oven.

Measure Name	Baseline Efficiency
Convection Oven	44%
Combination Oven	35%
Conveyer Oven	20% Heavy Load
Rack Oven	30%

High Efficiency

High efficiency case is an oven that meets or exceeds the high efficiency ratings per oven type shown in table below.

Measure Name	Efficiency Requirement
Convection Oven	>= 46%
Combination Oven	>= 44%
Conveyer Oven	>= 42%
Rack Oven	>= 50%

Hours

Not applicable.

Measure Life

The measure life is 12 years for all commercial ovens.[682]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

65,700 Gallons of water[683] for the combination oven

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Convection Oven	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Combination Oven	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Conveyer Oven	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Rack Oven	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Savings Persistence Factor
All PAs use 100% savings persistence factor.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Food Service – Commercial Griddle

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a gas griddle with efficiency of 38%.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[684].

Savings for Commercial Griddles

Measure Name	ΔMMBtu
Griddle	13.1

Baseline Efficiency

The baseline efficiency case is a standard efficiency (32% efficient) gas griddle.

High Efficiency

The high efficiency case is a gas griddle with an efficiency of 38%.

Hours

Not applicable.

Measure Life

The measure life is 12 years.[685]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

[684] Energy Star Commercial Kitchen Equipment Saving Calculator http://www.energystar.gov/products/certified-products/detail/commercial-food-service-equipment. Default values used. Accessed on 10/2/2015
[685] Ibid.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Griddle	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Food Service – Commercial Fryer

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a natural-gas fired fryer that is either ENERGY STAR® rated or has a heavy-load cooking efficiency of at least 50%. Qualified fryers use advanced burner and heat exchanger designs to use fuel more efficiently, as well as increased insulation to reduce standby heat loss.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed[686]

Savings for Commercial Fryers

Measure Name	ΔMMBtu
Fryer	50.8

Baseline Efficiency

The baseline efficiency case is a non-Energy Star qualified fryer.

High Efficiency

The high efficiency case is an Energy Star qualified fryer.

Hours

Not applicable.

Measure Life

The measure life is 12 years.[687]

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Fryer	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Food Service – Commercial Steamer

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of an ENERGY STAR® rated natural-gas fired steamer, either connectionless or steam-generator design, with heavy-load cooking efficiency of at least 38%. Qualified steamers reduce heat loss due to better insulation, improved heat exchange, and more efficient steam delivery systems.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: Water, Wastewater
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Food Service
Measure Type: Cooking Equipment
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed[688].

Savings for Commercial Steamers

Measure Name	ΔMMBtu
Steamer	105.4

Baseline Efficiency

The baseline efficiency case is a non-energy star steamer

High Efficiency

The high efficiency case is an ENERGY STAR® qualified gas-fired steamer.

Hours

The deemed savings assumes 4,380 annual operating hours (12 hours a day * 365 days/year).[689]

Measure Life

The measure life is 12 years.[690]

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[691] Ibid.

HVAC – Boilers

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a high efficiency natural gas fired condensing hot water boiler. High-efficiency condensing boilers can take advantage of improved design, sealed combustion and condensing flue gases in a second heat exchanger to achieve improved efficiency.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[692].

Savings for Boilers

Measure Name	ΔMMBtu
Condensing Boiler <= 300 mbh (.90 AFUE)	30.6
Condensing Boiler 301-499 mbh (.90 TE)	58.4
Condensing Boiler 500-999 mbh (.90 TE)	107.3
Condensing Boiler 1000-1700 mbh (.90 TE)	197.2
Condensing Boiler 1701+ mbh (.90 TE)	345.1
Condensing Boiler <= 300 mbh (.95 AFUE)	27.8

Baseline Efficiency

The baseline efficiency assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. The deemed savings methodology for this measure does not require specific baseline data, but the baseline information is provided here for use in the future when this is converted to a deemed calculated measure.

As described in Chapter 13 of the Massachusetts State Building Code, energy efficiency must be met via compliance with the International Energy Conservation Code (IECC) 2012. The table below details the specific efficiency requirements by equipment type and capacity. Baseline requirements for 2017 and on have not been finalized.

[692] KEMA (2013). *Impact Evaluation of 2011 Prescriptive Gas Measures*. Prepared for Massachusetts Energy Efficiency Program Administrators and Massachusetts Energy Efficiency Advisory Council; Page 1-2.

Baseline Efficiency Requirements for C&I Gas-Fired Boilers[693]

Equipment Type	Subcategory	Size Category (Input)	Minimum Efficiency (2016)[a]	Test Procedure
Boilers, Hot water	Gas-Fired	<300,000 Btu/h	82% AFUE	10 CFR Part 430
		>=300,000 Btu/h and <=2,500,000 Btu/h[b]	80% E_t	10 CFR Part 431
		>2,500,000 Btu/h[c]	82% E_c	

a. Annual Fuel Utilization Efficiency (AFUE), Thermal efficiency (Et), Combustion efficiency (Ec)
b. Maximum capacity – min. and max. ratings as provided for and allowed by the units controls
c. These requirements apply to boilers with rated input of 8 MMBtu/h or less that are not packaged boilers and to all packaged boilers. Minimum efficiency requirements for boilers cover all capacities of packaged boilers

High Efficiency

The high efficiency scenario assumes a gas-fired boiler that exceeds the efficiency levels required by Massachusetts State Building Code or federal code whichever has a higher value

Hours

Not applicable.

Measure Life

The measure life is 25 years.[694]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Condensing Boiler <= 300 mbh (.90 TE)	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Condensing Boiler 301-499 mbh (.90 TE)	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

Condensing Boiler 1000-1700 mbh (.90 TE)	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Condensing Boiler 1701+ mbh (.90 TE)	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Condensing Boiler <= 300 mbh (.95 TE)	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

[693] Adapted from 2012 International Energy Conservation Code; Table C403.2.3(5).
[694] ASHRAE Applications Handbook (2003); Page 36.3.

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Boiler Reset Controls

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Boiler Reset Controls are devices that automatically control boiler water temperature based on outdoor or return water temperature using a software program.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Heating
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[695].

Savings for Boiler Reset Controls

Measure Name	ΔMMBtu
Boiler Reset Control	35.5

Baseline Efficiency

The baseline efficiency case is a boiler without reset controls.

High Efficiency

The high efficiency case is a boiler with reset controls.

Hours

Not applicable.

Measure Life

The measure life is 15 years.[696]

[695] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks; the GDS Study assumes 710.46 MMBTU base use with 5% savings factor.
[696] ACEEE (2006). *Emerging Technologies Report: Advanced Boiler Controls*. Prepared for ACEEE; Page 2

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Boiler Reset Controls	Large Retrofit, Small Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Combo Water Heater/Boiler

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: This measure promotes the installation of a combined high-efficiency boiler and water heating unit. Combined boiler and water heating systems are more efficient than separate systems because they eliminate the standby heat losses of an additional tank.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC, Hot Water
Measure Type: Heating
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[697].

Savings for Combo Condensing Boiler/Water Heater

Measure Name	ΔMMBtu
Combo Condensing Boiler/Water Heater 90%	24.6
Combo Condensing Boiler/Water Heater 95%	31.8

Baseline Efficiency

The baseline efficiency case is a standard efficiency gas-fired storage tank hot water heater with a separate standard efficiency boiler for space heating purposes.

High Efficiency

The high efficiency case is either a condensing, integrated water heater/boiler with an AFUE of >=90% or AFUE>=95%.

Hours

Not applicable.

Measure Life

The measure life is 20 years.[698]

[697] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Combo Condensing Boiler/Water Heater 90%	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a
Combo Condensing Boiler/Water Heater 95%	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[698] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks.

HVAC – Condensing Unit Heaters

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a condensing gas-fired unit heater for space heating with capacity up to 300 MBH and minimum combustion efficiency of 90%.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[699].

Savings for Condensing Unit Heater

Measure Name	ΔMMBtu
Condensing Unit Heater <= 300 mbh	40.9

Baseline Efficiency

The baseline efficiency case is a standard efficiency gas fired unit heater with minimum combustion efficiency of 80%, interrupted or intermittent ignition device (IID), and either power venting or an automatic flue damper.[700] As a note, the baseline efficiency referenced applies to 2016. Baseline requirements for 2017 and on have not been finalized.

High Efficiency

The high efficiency case is a condensing gas unit heater with 90% AFUE or greater.

Hours

Not applicable.

[699] NYSERDA Deemed Savings Database (Rev 11); Measure Name: A.UNIT-HEATER-COND.<300000.CI._._.N. The database provides savings of 204.6 MMBtu per million BTU/hr of heater input capacity. Assume average unit size of 200,000 BTU capacity.
[700] 2012 International Energy Conservation Code

Measure Life

The measure life is 18 years.[701]

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Condensing Unit Heater <= 300 mbh	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[701] Ecotrope, Inc. (2003). *Natural Gas Efficiency and Conservation Measure Resource Assessment for the Residential and Commercial Sectors*. Prepared for the Energy Trust of Oregon.

HVAC – Furnaces

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a high efficiency natural gas warm air furnace with an electronically commutated motor (ECM) for the fan. High efficiency furnaces are better at converting fuel into direct heat and better insulated to reduce heat loss. ECM fan motors significantly reduce fan motor electric consumption as compared to both shaped-pole and permanent split capacitor motors.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: Electric
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[702].

Savings for Furnaces

Measure Name	ΔMMBtu
Furnace w/ECM 95%	5.7
Furnace w/ECM 97%	6.7

Baseline Efficiency

The baseline efficiency assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. The deemed savings methodology for this measure does not require specific baseline data, but the baseline information is provided here for use in the future if this is converted to a deemed calculated measure.

As described in the Massachusetts State Building Code, energy efficiency must be met via compliance with the relevant International Energy Conservation Code (IECC) 2012. The table below details the specific efficiency requirements by equipment type and capacity. Baseline requirements for 2017 and on have not been finalized.

[702] DNV-GL (2015). *Recalculation of Prescriptive Program Gas Furnace Savings Using New Baseline.* Prepared for Massachusetts Energy Efficiency Program Administrators & Massachusetts Energy Efficiency Advisory Council.

Baseline Efficiency Requirements for Gas-Fired Furnaces[703]

Equipment Type	Size Category (Input)	Minimum Efficiency (2016)
Warm air furnaces, gas fired	< 225,000 Btu/h	85% AFUE

High Efficiency

The high efficiency scenario assumes either a gas-fired furnace equal or higher than 95% AFUE or 97 AFUE.

Hours

Not applicable.

Measure Life

The measure life is 18 years.[704]

Secondary Energy Impacts

High efficiency furnaces equipped with ECM fan motors also save electricity from reduced fan energy requirements. The reduction of electric use is 168 kWh and 0.124 kW[705]. See HVAC – Furnace Fan Motors (ECM) in the Residential section.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Furnace w/ECM 95%	NB, EUL	All	1.00	1.00	1.00	1.00	0.00	0.16
Furnace w/ECM 97%	NB, EUL	All	1.00	1.00	1.00	1.00	0.00	0.16

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[703] Agreed upon value with EEAC consultants

HVAC – Infrared Heaters

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The installation of a gas-fired low intensity infrared heating system in place of unit heater, furnace, or other standard efficiency equipment. Infrared heating uses radiant heat as opposed to warm air to heat buildings. In commercial environments with high air exchange rates, heat loss is minimal because the space's heat comes from surfaces rather than air.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: HVAC
Measure Type: Heating
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[706].

Savings for Infrared Heaters

Measure Name	ΔMMBtu
Infrared Heaters	12.0

Baseline Efficiency

The baseline efficiency case is a standard efficiency gas-fired unit heater with combustion efficiency of 80%.

High Efficiency

The high efficiency case is a gas-fired low-intensity infrared heating unit.

Hours

Not applicable.

Measure Life

The measure life is 17 years.[707]

[706] KEMA (2013). *Impact Evaluation of 2011 Prescriptive Gas Measures.* Prepared for Massachusetts Energy Efficiency Program Administrators and Massachusetts Energy Efficiency Advisory Council; Page 1-5.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Infrared Heaters	NB, EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[707] Nexant (2006). *DSM Market Characterization Report*. Prepared for Questar Gas.

HVAC – Thermostats

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a programmable thermostat with the ability to adjust heating or air-conditioning operating times according to a pre-set schedule to meet occupancy needs and minimize redundant HVAC operation.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Controls
Core Initiative: C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[708,709]

Savings for Programmable Thermostats

Measure Name	Core Initiative	PA	ΔMMBtu
Programmable Thermostat	Large Retrofit	All	3.2
Programmable Thermostat	Small Retrofit	All	3.2
Programmable Thermostat	C&I MF Retrofit	All	2.3

Baseline Efficiency

The baseline efficiency case is an HVAC system using natural gas to provide space heating without a programmable thermostat.

High Efficiency

The high efficiency case is an HVAC system using natural gas to provide space heating with a 7-day programmable thermostat installed.

Hours

Not applicable.

Programmable Thermostat	C&I MF Retrofit	All	1.00	0.60	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[710] Environmental Protection Agency (2010). *Life Cycle Cost Estimate for ENERGY STAR Programmable Thermostat*.

HVAC – Duct Sealing and Insulation

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: For existing ductwork in non-conditioned spaces, seal and insulate ductwork. This could include replacing un-insulated flexible duct with rigid insulated ductwork or sealing leaky fixed ductwork with mastic or aerosol and installing 1" – 2" of duct-wrap insulation.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Ducting
Core Initiative: C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results:

$$\Delta MMBtu = \Delta MMBtu * Unit$$

Where:

Unit	=	Number of square feet of ductwork treated
ΔMMBtu	=	Average annual MMBtu savings per unit: 0.13[711]

Baseline Efficiency

The baseline efficiency case is existing, non-sealed (leaky) and un-insulated ductwork in unconditioned spaces (e.g. attic or basement)

High Efficiency

The high efficiency condition is air sealed and insulated ductwork in unconditioned spaces.

Hours

Not Applicable.

Measure Life

The measure life is 20 years.[712]

[711] National Grid Staff Estimate (2010) MA SBS-DI Duct Sealing and Insulation Scenario and Deemed Savings.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Duct Sealing and Insulation	Large Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a
Duct Sealing and Insulation	Small Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a
Duct Sealing and Insulation	C&I MF Retrofit	All	1.00	0.60	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

HVAC – Pipe Wrap (Heating)

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Install insulation on steam piping located in non-conditioned spaces.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Insulation
Core Initiative: C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[713,714]

Savings for Steam Pipe Insulation

Measure Name	Core Initiative	PA	ΔMMBtu per linear foot
Steam Pipe Insulation, <=1.5"	Large Retrofit, Small Retrofit	All	0.21
Steam Pipe Insulation, 3"	Large Retrofit, Small Retrofit	All	0.37
Pipe Wrap (Heating)	C&I MF Retrofit	All	0.16

Baseline Efficiency

The baseline efficiency case is un-insulated steam piping in unconditioned space.

High Efficiency

The high efficiency condition is steam piping in unconditioned space with insulation installed.

Hours

Not Applicable.

Measure Life

The measure life is 15 years[715].

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Process – Steam Traps

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Repair or replace malfunctioning steam traps.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: Refer to Appendix C: Non-Resource Impacts
Sector: Commercial & Industrial
Market: Retrofit
End Use: HVAC
Measure Type: Steam Traps
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[716]:

Savings for Steam Traps

Measure Name	ΔMMBtu
Steam Trap - Prescriptive	25.7

Baseline Efficiency

The baseline efficiency case is a failed steam trap.

High Efficiency

The high efficiency case is a repaired or replaced steam trap.

Hours

Not applicable.

Measure Life

The measure life is 6 years.[717]

[716] National Grid (2008). National Grid 2008 Steam Trap Savings Calculation. Based on historical steam trap surveys steam losses in lbs/hr are found using "Boiler Efficiency Institute (1987). *Steam Efficiency Improvement*.; Page 34, Table 4.1 under Steam Leak Rate Through Holes. Average loss rate for all trap sizes 1/32" to 1/4" for low steam pressures (5 psig and 10 psig) and high pressures (50 psig and 100 psig). Assume trap failure effective for 540 EFLH per year. Determine to equivalent therms per year and factor for frequency encountered = [80% * (78.50 + 111.46)/2] + [20% * (1,108.04 + 1,982.18)/2] = 385.01 BTU/trap-year. Assume that 50% of traps fail in the open position and savings is grossed up by the efficiency of the boiler supplying the steam of (inverse of 75%). Net savings is 257 therms per trap.
[717] DNV GL (2015) *Massachusetts 2013 Prescriptive Gas Impact Evaluation – Steam Trap Evaluation Phase I.* Prepared for Massachusetts Energy Efficiency Program Administrators & Massachusetts Energy Efficiency Advisory Council.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings
Annual Non-Resource	See Appendix C: Non-Resource Impacts	See Appendix C: Non-Resource Impacts

Impact Factors for Calculating Adjusted Gross Savings

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Water Heating – Indirect Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Indirect water heaters use a storage tank that is heated by the main boiler. The energy stored by the water tank allows the boiler to turn off and on less often, saving considerable energy.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[721].

Savings for Indirect Water Heaters

Measure Name	ΔMMBtu
Indirect Water Heater - Upstream	19.0

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. As described in the MA State Building Code, energy efficiency must be met via compliance with the relevant International Energy Conservation Code (IECC) 2012. The assumed efficiency slightly exceeds the minimum required by code to reflect the typical baseline unit available in the marketplace. Baseline requirements for 2017 and on have not been finalized.

For indirect water heaters the baseline is a hot water boiler operating at 78% recovery efficiency. Additionally a baseline storage water heater was assumed for purposed of estimating standby losses.[722]

High Efficiency

The high efficiency scenario is an indirect water heater with a Combined Appliance Efficiency (CAE) of 85% or greater.

Water Heating – Tankless Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Tankless water heaters circulate water through a heat exchanger to be heated for immediate use, eliminating the standby heat loss associated with a storage tank.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Hot water
Measure Type: Water Heater
Core Initiative: C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed[724].

Savings for Tankless Water Heaters

Measure Name	ΔMMBtu
Tankless Water Heater 0.82 - Upstream	6.6
Tankless Water Heater 0.94 - Upstream	9.0

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. As described in the MA State Building Code, energy efficiency must be met via compliance with the relevant International Energy Conservation Code (IECC) 2012. The assumed efficiency slightly exceeds the minimum required by code to reflect the typical baseline unit available in the marketplace. Baseline requirements for 2017 and on have not been finalized.

For on-demand tankless water heaters the baseline is a code-compliant gas-fired storage water heater with EF = 0.61.[725]

[724] Title 10, Code of Federal Regulations, Part 430-Energy Conservation Program for Consumer Products, Subpart C – Energy and Water Conservation Standards and Their Effective Dates. January 1, 2010; Energy Conservation standards for Residential Water Heaters, Direct Heating Equipment, and Pool Heaters; Final Rule, Federal Register, 75 FR 20112, April 16, 2010.

Water Heating – Condensing Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a high-efficiency gas-fired water heater.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed[727].

Savings for Condensing Water Heaters

Measure Name	ΔMMBtu
Condensing Water Heater 0.95 - Upstream	25.0

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. As described in the MA State Building Code, energy efficiency must be met via compliance with the relevant International Energy Conservation Code (IECC) 2012. The assumed efficiency slightly exceeds the minimum required by code to reflect the typical baseline unit available in the marketplace. Baseline requirements for 2017 and on have not been finalized.

For condensing stand-alone water heaters, the assumed baseline is a stand-alone tank water heater with a thermal efficiency of 80%.[728]

High Efficiency

The high efficiency case is a condensing stand alone commercial water heater with a thermal efficiency of 95% or greater and a capacity between 75,000 Btu and 300,000 Btu.

[727] Title 10, Code of Federal Regulations, Part 430-Energy Conservation Program for Consumer Products, Subpart C – Energy and Water Conservation Standards and Their Effective Dates. Not applicable for this measure since no electric savings are claimed.

[729] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks; Page 2 of Appendix B-2, measure GDS C-WH-4. The GDS study references "ACEEE (2004). *Emerging technologies and practices*; W1 - pg 46."

Water Heating – Stand Alone Water Heater

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a high-efficiency gas-fired water heater.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: None
Sector: Commercial & Industrial
Market: Lost Opportunity
End Use: Hot Water
Measure Type: Water Heater
Core Initiative: C&I Initial Purchase & End of Useful Life

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[730].

Savings for Stand Alone Water Heaters

Measure Name	ΔMMBtu
Stand Alone Water Heater 0.67 - Upstream	2.4

Baseline Efficiency

The baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code. As described in the MA State Building Code, energy efficiency must be met via compliance with the relevant International Energy Conservation Code (IECC) 2012. The assumed efficiency slightly exceeds the minimum required by code to reflect the typical baseline unit available in the marketplace. Baseline requirements for 2017 and on have not been finalized.

For free-standing water heaters the baseline is a code-compliant gas-fired storage water heater with EF = 0.59.[731]

High Efficiency

The high efficiency case is an ENERGY STAR® gas-fired freestanding hot water heater with an Energy Factor of at least 0.67 and a nominal input of 75,000 BTU/hour or less.

[730] Title 10, Code of Federal Regulations, Part 430-Energy Conservation Program for Consumer Products, Subpart C – Energy and Water Conservation Standards and Their Effective Dates. There are no secondary energy impacts for this measure.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Stand Alone Water Heater 0.67 - Upstream	EUL	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[732] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks; Appendix A-2.

Water Heating – Pre-Rinse Spray Valve

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Retrofitting existing standard spray nozzles in locations where service water is supplied by natural gas fired hot water heater with new low flow pre-rinse spray nozzles with an average flow rate of 1.6 GPM.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: C&I Water, C&I Sewer
Sector: Commercial, Industrial
Market: Retrofit
End Use: Hot Water
Measure Type: Flow Control
Core Initiative: C&I Existing Building Retrofit, C&I Small Business

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[733].

Savings for Pre-Rise Spray Valves

Measure Name	ΔMMBtu
Pre-Rinse Spray Valve	11.4

Baseline Efficiency

The baseline efficiency case is an existing efficiency spray valve.

High Efficiency

The high efficiency case is a low flow pre-rinse spray valve with an average flow rate of 1.6 GPM.

Hours

Not applicable.

Measure Life

The measure life is 8 years.[734]

[734] Ibid.

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Description	Savings[735]
C&I Water	C&I water savings	6,410 gallons/unit
C&I Sewer	C&I sewer water savings	6,410 gallons/unit

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Pre-Rinse Spray Valve	Large Retrofit, Small Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[735] Ibid.

Water Heating – Low-Flow Shower Heads

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a low flow showerhead with a flow rate of 1.5 GPM or less in a commercial setting with service water heated by natural gas.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: C&I Water, C&I Sewer
Sector: Commercial
Market: Retrofit
End Use: Hot water
Measure Type: Flow Control
Core Initiative: C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed[736,737]

Savings for Low-Flow Shower Heads

Measure Name	Core Initiative	PA	ΔMMBtu
Low-Flow Showerhead	Large Retrofit	All	2.65
Low-Flow Showerhead	Small Retrofit	All	2.65
Low-Flow Showerhead	C&I MF Retrofit	All	1.14

Baseline Efficiency

The baseline efficiency case is a 2.5 GPM showerhead.

High Efficiency

The high efficiency case is a 1.5 GPM showerhead.

Hours

Not Applicable.

[736] Department of Energy Calculator for Faucets & Showerheads. http://energy.gov/eere/femp/energy-cost-calculator-faucets-and-showerheads-0. Subsequently revised for lower anticipated hot water use. Baseline values were used with the exception of hot water use. This was changed from 100% to 50%.
[737] The Cadmus Group (2012). *Massachusetts Multifamily Program Impact Analysis July 2012 – Revised May 2013.* Prepared for Massachusetts Program Administrators.

Measure Life

The measure life is 10 years in the Large Retrofit and Small Retrofit initiatives.[738] The measure life is 7 years in the C&I MF Retrofit initiative[739].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Core Initiative	Description	Savings
C&I Water	Large Retrofit, Small Retrofit	C&I water savings	7,300 gallons/unit[740]
C&I Sewer	Large Retrofit, Small Retrofit	C&I sewer water savings	7,300 gallons/unit[741]
Residential Water	C&I MF Retrofit	Multifamily water savings for low-flow showerheads	2,165 Gallons/Unit[742]

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Low-Flow Showerhead	Large Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a
Low-Flow Showerhead	Small Retrofit	All	1.00	1.00	n/a	n/a	n/a	n/a
Low-Flow Showerhead	C&I MF Retrofit	All	1.00	0.60	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Water Heating – Faucet Aerator

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Installation of a faucet aerator with a flow rate of 1.5 GPM or less on an existing faucet with high flow in a commercial setting with service water heated by natural gas.
Primary Energy Impact: Natural Gas
Secondary Energy Impact: None
Non-Energy Impact: C&I Water, C&I Sewer
Sector: Commercial
Market: Retrofit
End Use: Hot water
Measure Type: Flow Control
Core Initiative: C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Unit savings are deemed based on study results[743,744]

Savings for Faucet Aerators

Measure Name	Core Initiative	PA	ΔMMBtu
Faucet Aerator	Large Retrofit	All	1.7
Faucet Aerator	Small Retrofit	All	1.7
Faucet Aerator	C&I MF Retrofit	All	0.86

Baseline Efficiency

The baseline efficiency case is a 2.2 GPM faucet.

High Efficiency

The high efficiency case is a faucet with 1.5 GPM or less aerator installed.

Hours

The savings estimates for this measure are determined empirically in terms of units installed and so the equivalent heating full load hours are not directly used, however, the calculator used to determine the deemed savings uses a default operation of 30 minutes a day, 260 days a year.

[743] GDS Associates, Inc. (2009). *Natural Gas Energy Efficiency Potential in Massachusetts*. Prepared for GasNetworks; Table B-2a, measure C-WH-16.
[744] The Cadmus Group (2012). *Massachusetts Multifamily Program Impact Analysis July 2012 – Revised May 2013*. Prepared for Massachusetts Program Administrators.

Measure Life

The measure life is 10 years in the Large Retrofit and Small Retrofit initiatives.745 The measure life is 7 years in the C&I MF Retrofit initiative[746].

Secondary Energy Impacts

There are no secondary energy impacts for this measure.

Non-Energy Impacts

Benefit Type	Core Initiative	Description	Savings[747]
C&I Water	Large Retrofit, Small Retrofit	C&I water savings	5,460 gallons/unit
C&I Sewer	Large Retrofit, Small Retrofit	C&I sewer water savings	5,460 gallons/unit
Residential Water	C&I MF Retrofit	Residential water savings for faucet aerators [748]	332 Gallons/Unit

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Faucet Aerator	Large Retrofit	All	1.00	1.00	1.00	1.00	n/a	n/a
Faucet Aerator	Small Retrofit	All	1.00	1.00	1.00	1.00	n/a	n/a
Faucet Aerator	C&I MF Retrofit	All	1.00	0.60	1.00	1.00	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Realization Rates
All PAs use 100% energy realization rate. The summer and winter peak realization rates are not applicable for this measure since there are no electric savings claimed.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Whole Building - Building Operator Certification

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: Building Operator Certification (BOC) is a nationally recognized training program designed to educate facilities personnel in the energy and resource efficient operation and maintenance of building systems. Savings include only operations, maintenance and controls savings.
Primary Energy Impact: Gas
Secondary Energy Impact: Project Specific
Non-Energy Impact: Project Specific
Sector: Commercial & Industrial
Market: Retrofit
End Use: All
Measure Type: Custom
Core Initiative: C&I Existing Building Retrofit

Algorithms for Calculating Primary Energy Impact

Savings are deemed based on study results[749]

Savings for Building Operator Certification

Measure Name	ΔMMBtu/SF/Student
BOC – O&M Only	0.0007
BOC – O&M plus Capital Upgrades	0.0011

Baseline Efficiency

No BOC training

High Efficiency

Completion and certification in a BOC level I or level II training course.

Measure Life

Measure life of 5 years[750]

Secondary Energy Impacts

There are no secondary energy impacts.

[749] Navigant Consulting (2015). *Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification.* Prepared for the Massachusetts Program Administrators and the Energy Efficiency Advisory Council
[750] Ibid.

Non-Energy Impacts

There are no non-energy impacts for this measure.

Impact Factors for Calculating Adjusted Gross Savings

Measure Name	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
BOC Training	Large Retrofit	National Grid	1.00	1.00	1.00	1.00	1.00	1.00

In-Service Rates
n/a

Realization Rates
Realization rates are set to 100% since savings are based off of evaluation results.

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

Custom Measures

Version Date and Revision History

Effective Date: 1/1/2016
End Date: TBD

Measure Overview

Description: The Custom project track is offered for energy efficiency projects involving complex site-specific applications that require detailed engineering analysis and/or projects which do not qualify for incentives under any of the prescriptive rebate offering. Projects offered through the custom approach must pass a cost-effectiveness test based on project-specific costs and savings.
Primary Energy Impact: Natural Gas (Heating, Water Heating, or All)
Secondary Energy Impact: Project Specific
Non-Energy Impact: Project Specific
Sector: Commercial & Industrial
Market: Lost Opportunity, Retrofit
End Use: All
Measure Type: Varies
Core Initiative: C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit, C&I Small Business, C&I Multifamily Retrofit

Algorithms for Calculating Primary Energy Impact

Gross therm savings estimates for custom projects are calculated using engineering analysis and project-specific details. Custom analyses typically include a weather dependent load bin analysis, whole building energy model simulation, or other engineering analysis and include estimates of savings, costs, and an evaluation of the project's cost-effectiveness.

Baseline Efficiency

For Lost Opportunity projects, the baseline efficiency case assumes compliance with the efficiency requirements as mandated by Massachusetts State Building Code or industry accepted standard practice.

For retrofit projects, the baseline efficiency case is the same as the existing, or pre-retrofit, case for the facility.

High Efficiency

The high efficiency scenario is specific to the custom project and may include one or more energy efficiency measures. Energy and demand savings calculations are based on projected changes in equipment efficiencies and operating characteristics and are determined on a case-by-case basis. The project must be proven cost-effective in order to qualify for energy efficiency incentives.

Hours

All hours for custom savings analyses should be determined on a case-by-case basis.

Measure Life

For both lost-opportunity and retrofit custom applications, the measure life is determined on a case-by-case basis.

Secondary Energy Impacts

All secondary energy impacts should be determined on a case-by-case basis.

Non-Energy Impacts

All non-energy impacts should be determined on a case-by-case basis.

Impact Factors for Calculating Adjusted Gross Savings

Measure	Core Initiative	PA	ISR	RR_E	RR_{SP}	RR_{WP}	CF_{SP}	CF_{WP}
Custom	NB, EUL	Liberty, Berkshire, Unitil	1.00	0.883	n/a	n/a	n/a	n/a
Custom	NB, EUL	Eversource (NSTAR)	1.00	0.918	n/a	n/a	n/a	n/a
Custom	NB, EUL	National Grid	1.00	0.779	n/a	n/a	n/a	n/a
Custom	NB, EUL	Columbia Gas	1.00	0.727	n/a	n/a	n/a	n/a
Custom	Large Retrofit, Small Retrofit, C&I MF Retrofit	Liberty, Berkshire, Unitil	1.00	0.883	n/a	n/a	n/a	n/a
Custom	Large Retrofit, Small Retrofit, C&I MF Retrofit	Eversource (NSTAR)	1.00	0.918	n/a	n/a	n/a	n/a
Custom	Large Retrofit, Small Retrofit, C&I MF Retrofit	National Grid	1.00	0.779	n/a	n/a	n/a	n/a
Custom	Large Retrofit, Small Retrofit, C&I MF Retrofit	Columbia Gas	1.00	0.727	n/a	n/a	n/a	n/a

In-Service Rates
All installations have 100% in service rate since programs include verification of equipment installations.

Savings Persistence Factor
All PAs use 100% savings persistence factor.

Realization Rates
Eversource (NSTAR), National Grid, and Columbia Gas use PA-specific results while all other Pas use the statewide average.[751].

Coincidence Factors
Not applicable for this measure since no electric savings are claimed.

[751]DNV GL & ERS (2015) *Project 43 Impact Evaluation of PY2013 Custom Gas Installations.* Prepared for Massachusetts Energy Efficiency Program Administrators & Massachusetts Energy Efficiency Advisory Council.

Sources

Unless otherwise stated below, all PA's use Massachusetts common assumptions for all residential measure free-ridership and spillover values.

- The Net-to-Gross factors used in Residential New Construction for Heating, Cooling, and Water Heating are based on evaluation results[759] adjusted downward from an agreement with the EEAC consultants to account for the age of the study and the new Codes and Standards measure.
- The Net-to-Gross factors used in Residential Lighting and Residential New Construction for CFL Bulb and LED Bulb are from the Multistage Lighting Net-to-Gross Assessment: Overall Report[760]. The values change each year.
- The Net-to-Gross factors used in Residential Consumer Products for the Refrigerator and Freezer Recycling measures are from the Massachusetts Appliance Turn-in Program Evaluation Integrated Report Findings Report.[761]
- The Net-to-Gross factors used in Residential Heating & Cooling Equipment are from the 2012 Cool Smart and HEHE Program Evaluation report[762]
- The Net-to-Gross factors used in Residential Home Energy Services for CFL Bulb, Refrigerator, Air Sealing, and Insulation are from the Massachusetts 2011 Residential Retrofit and Low Income Net to Gross Evaluation[763]. The free-ridership for CFL Bulbs was based on this study but modified by agreement with the EEAC consultants on 7-2-12, to account for the potential for participants who would have bought CFLs outside of the HES program but through the Upstream Lighting program.
- The Net-to-Gross factors used in Residential Home Energy Services for Thermostats, Heating System Replacement and Water Heater measures are from the 2010 Net-to-Gross Findings: Home Energy Assessment study.[764]
- The Net-to-Gross factors used in Multifamily Retrofit are based on the 2011 NTG Study[765].

EVALUATIONS

All factors except for Upstream Lighting are from the National Grid, NSTAR, Western Massachusetts Electric Company, Unitil, and Cape Light Compact 2013 Commercial and Industrial Electric Programs Free-ridership and Spillover Study.[766] Upstream LED Linear are MA Common Assumptions. Upstream LED Fluorescent comes from the Upstream Lighting Process evaluation completed in 2013[767] Upstream LED Screw in comes from the C&I LED Spillover study[768].

Sources

For C&I New Buildings & Major Renovations, C&I Initial Purchase & End of Useful Life, C&I Existing Building Retrofit, C&I Small Business and C&I Multifamily Retrofit all Net-to-Gross factors are based on the results of the 2014-2015 Commercial and Industrial Natural Gas Programs Free-ridership and Spillover Study conducted by TetraTech for the MA Gas PAs.[769] This study developed free-ridership and participant spillover rates for each PA for prescriptive and custom measures. PAs that had fewer than 10 customers surveyed for a program type used the statewide rates.

For C&I Multifamily Retrofit, National Grid, Eversource, Berkshire and Liberty use the Custom NTG values for Custom measures and the Prescriptive NTG values for all other measures. Columbia uses Custom NTG values for all C&I MF Retrofit measures.

[769] TetraTech (2015). National Grid, Eversource, Unitil, Berkshire Gas, Columbia Gas of MA, and Liberty Utilities 2014-2015 Commercial and Industrial Natural Gas Programs Free-ridership and Spillover Study. August 2015.

Appendix E: Acronyms

ACRONYM	DESCRIPTION
AC	Air Conditioning
AFUE	Annual Fuel Utilization Efficiency (see the Glossary)
AHU	Air Handling Unit
Btu	British Thermal Unit (see the Glossary)
CF	Coincidence Factor (see the Glossary)
CFL	Compact Fluorescent Lamp
CHP	Combined Heat and Power
COP	Coefficient of Performance (see the Glossary)
DCV	Demand Controlled Ventillation
DHW	Domestic Hot Water
DOER	Department of Energy Resources
DSM	Demand Side Management (see the Glossary)
ECM	Electrically Commutated Motor
EER	Energy Efficiency Ratio (see the Glossary)
EF	Efficiency Factor
EFLH	Equivalent Full Load Hours (see the Glossary)
ES	ENERGY STAR® (see the Glossary)
FCM	Forward Capacity Market
FR	Free-Ridership (see the Glossary)
HE	High-Efficiency
HID	High-Intensity Discharge (a lighting technology)
HP	Horse Power (see the Glossary)
HSPF	Heating Seasonal Performance Factor (see the Glossary)
HVAC	Heating, Ventilating, and Air Conditioning
ISO	Independent System Operator
ISR	In-Service Rate (see the Glossary)
kW	Kilo-Watt, a unit of electric demand equal to 1,000 watts
kWh	Kilowatt-Hour, a unit of energy (1 kilowatt of power supplied for one hour)
LED	Light-Emitting Diode (one type of solid-state lighting)
LCD	Liquid Crystal Display (a technology used for computer monitors and similar displays)
MMBtu	One million British Thermal Units (see “Btu” in the Glossary)
MW	Megawatt – a measure of electric demand equal to 1,000 kilowatts
MWh	Megawatt-hour – a measure of energy equal to 1,000 kilowatt-hours
NEB	Non-Electric Benefit (see the Glossary)
NEI	Non-Energy Impact
NE-ISO	New England Independent System Operator
NTG	Net-to-Gross (see the Glossary)
O&M	Operations and Maintenance
PA	Program Administrator (see the Glossary)
PARIS	Planning And Reporting Information System (a DOER database - see the Glossary)
PC	Personal Computer
RR	Realization Rate (see the Glossary)
SEER	Seasonal Energy Efficiency Ratio (see the Glossary)
SO	Spillover (see the Glossary)
SPF	Savings Persistence Factor (see the Glossary)
SSL	Solid-State Lighting (e.g., LED lighting)
VSD	Variable-Speed Drive

Appendix F: Glossary

This glossary provides definitions as they are applied in this TRM for Massachusetts' energy efficiency programs. Alternate definitions may be used for some terms in other contexts.

TERM	DESCRIPTION
Adjusted Gross Savings	Gross savings (as calculated by the measure savings algorithms) that have been subsequently adjusted by the application of all impact factors except the net-to-gross factors (free-ridership and spillover). For more detail, see the section on Impact Factors for Calculating Adjusted Gross and Net Savings.
AFUE	Annual Fuel Utilization Efficiency. The measure of seasonal or annual efficiency of a furnace or boiler. AFUE takes into account the cyclic on/off operation and associated energy losses of the heating unit as it responds to changes in the load, which in turn is affected by changes in weather and occupant controls.
Baseline Efficiency	The level of efficiency of the equipment that would have been installed without any influence from the program or, for retrofit cases where site-specific information is available, the actual efficiency of the existing equipment.
Btu	British thermal unit. A Btu is approximately the amount of energy needed to heat one pound of water by one degree Fahrenheit.
Coefficient of Performance (COP)	Coefficient of Performance is a measure of the efficiency of a heat pump, air conditioner, or refrigeration system. A COP value is given as the Btu output of a device divided by the Btu input of the device. The input and output are determined at AHRI testing standards conditions designed to reflect peak load operation.
Coincidence Factor (CF)	Coincidence Factors represent the fraction of connected load expected to occur concurrent to a particular system peak period; separate CF are found for summer and winter peaks. The CF given in the TRM includes both coincidence and diversity factors multiplied into one number. Coincidence factors are provided for peak periods defined by the NE-ISO for FCM purposes and calculated consistent with the FCM methodology.
Connected Load kW Savings	The connected load kW savings is the power saved by the equipment while in use. In some cases the savings reflect the maximum power draw of equipment at full load. In other cases the connected load may be variable, which must be accounted for in the savings algorithm.
Deemed Savings	Savings values (electric, fossil fuel and/or non-energy benefits) determined from savings algorithms with assumed values for all algorithm parameters. Alternatively, deemed savings values may be determined from evaluation studies. A measure with deemed savings will have the same savings per unit since all measure assumptions are the same. Deemed savings are used by program administrators to report savings for measures with well-defined performance characteristics relative to baseline efficiency cases. Deemed savings can simplify program planning and design, but may lead to over- or under-estimation of savings depending on product performance.
Deemed Calculated Savings	Savings values (electric, fossil fuel and/or non-energy benefits) that depend on a standard savings algorithm and for which at least one of the algorithm parameters (e.g., hours of operation) is project specific.
Demand Savings	The reduction in demand due to installation of an energy efficiency measure, usually expressed as kW and measured at the customer's meter (see Connected Load kW Savings).
Demand Side Management (DSM)	Strategies used to manage energy demand including energy efficiency, load management, fuel substitution, and load building.
Diversity	A characteristic of a variety of electric loads whereby individual maximum demands occur at different times. For example, 50 efficient light fixtures may be installed, but they are not necessarily all on at the same time. See Coincidence Factor.

TERM	DESCRIPTION
Diversity Factor	This TRM uses coincidence factors that incorporate diversity (See Coincidence Factor), thus this TRM has no separate diversity factors. A diversity factor is typically calculated as: 1) the percent of maximum demand savings from energy efficiency measures available at the time of the company's peak demand, or 2) the ratio of the sum of the demands of a group of users to their coincident maximum demand.
End Use	Refers to the category of end use or service provided by a measure or technology (e.g., lighting, cooling, etc.). For the purpose of this manual, end uses with their PARIS codes include: ALght Lighting; HEUBe Behavior HVAC HVAC; Ienvl Insulation & Air Sealing CMoDr Motors & Drives; JGchp Combined Heat & Power DRefr Refrigeration; KSdhw Solar Hot Water EHoWa Hot Water; LDmdR Demand Response FComA Compressed Air; MPvEl Photovoltaic Panels GProc Process* *For residential measures, "process" is used for products that have low savings, such as consumer electronics, or do not conform to existing end use categories. For commercial and industrial measures, "process" is used for systematic improvements to manufacturing or pump systems, or efficient models of specialty equipment not covered in other end uses.
Energy Efficiency Ratio (EER)	The Energy Efficiency Ratio is a measure of the efficiency of a cooling system at a specified peak, design temperature, or outdoor temperature. In technical terms, EER is the steady-state rate of heat energy removal (i.e. cooling capacity) of a product measured in Btuh output divided by watts input.
ENERGY STAR® (ES)	Brand name for the voluntary energy efficiency labeling initiative sponsored by the U.S. Environmental Protection Agency.
Energy Costing Period	A period of relatively high or low system energy cost, by season. The energy periods defined by ISO-NE are: • **Summer Peak**: 6am–10pm, Monday–Friday (except ISO holidays), June–September • **Summer Off-Peak:** Summer hours not included in the summer peak hours: 10pm–6am, Monday–Friday, all day on Saturday and Sunday, and ISO holidays, June–September • **Winter Peak:** 6am–10pm, Monday–Friday (except ISO holidays), January–May and October–December • **Winter Off-Peak:** Winter hours not included in the sinter peak hours: 10pm–6am, Monday–Friday, all day on Saturday and Sunday, and ISO holidays, January–May and October–December.
Equivalent Full Load Hours (EFLH)	The equivalent hours that equipment would need to operate at its peak capacity in order to consume its estimated annual kWh consumption (annual kWh/connected kW).
Free Rider	A customer who participates in an energy efficiency program, but would have installed some or all of the same measure(s) on their own, with no change in timing of the installation, if the program had not been available.
Free-Ridership Rate	The percentage of savings attributable to participants who would have installed the measures in the absence of program intervention.
Gross kW	Expected demand reduction based on a comparison of standard or replaced equipment and equipment installed through an energy efficiency program.
Gross kWh	Expected kWh reduction based on a comparison of standard or replaced equipment and equipment installed through an energy efficiency program.

TERM	DESCRIPTION
Gross Savings	A saving estimate calculated from objective technical factors. In this TRM, "gross savings" are calculated with the measure algorithms and do not include any application of impact factors. Once impact factors are applied, the savings are called "Adjusted Gross Savings". For more detail, see the section on Impact Factors for Calculating Adjusted Gross and Net Savings.
High Efficiency (HE)	Refers to the efficiency measures that are installed and promoted by the energy efficiency programs.
Horsepower (HP)	A unit for measuring the rate of doing work. One horsepower equals about three-fourths of a kilowatt (745.7 watts).
Heating Seasonal Performance Factor (HSPF)	A measure of the seasonal heating mode efficiencies of heat pumps expressed as the ratio of the total heating output to the total seasonal input energy.
Impact Factor	Generic term for a value used to adjust the gross savings estimated by the savings algorithms in order to reflect the actual savings attributable to the efficiency program. In this TRM, impact factors include realization rates, in-service rates, savings persistence, peak demand coincidence factors, free-ridership, spillover and net-to-gross factors. See the section on Impact Factors for more detail.
In-Service Rate	The percentage of units that are actually installed. For example, efficient lamps may have an in-service rate less than 100% since some lamps are purchased as replacement units and are not immediately installed. The in-service rate for most measures is 100%.
Measure Life	The number of years that an efficiency measure is expected to garner savings. These are generally based on engineering lives, but sometimes adjusted based on observations of market conditions.
Lost Opportunity	Refers to a measure being installed at the time of planned investment in new equipment or systems. Often this reflects either new construction, renovation, remodeling, planned expansion or replacement, or replacement of failure.
Measure	A product (a piece of equipment), combination of products, or process designed to provide energy and/or demand savings. Measure can also refer to a service or a practice that provides savings. Measure can also refer to a specific combination of technology and market/customer/practice/strategy (e.g., direct install low income CFL).
Net Savings	The final value of savings that is attributable to a program or measure. Net savings differs from gross savings (or adjusted gross savings) because it includes adjustments due to free-ridership and/or spillover. Net savings is sometimes referred to as "verified" or "final" savings. For more detail see the section on Impact Factors for Calculating Adjusted Gross and Net Savings.
Net-to-Gross Ratio	The ratio of net savings to the adjusted gross savings (for a measure or program). The adjusted gross savings include any adjustment by the impact factors other than free-ridership or spillover. Net-to-gross is usually expressed as a percent.
Non-Electric Benefits (NEBs)	Quantifiable benefits (beyond electric savings) that are the result of the installation of a measure. Fossil fuel, water, and maintenance are examples of non-electric benefits. Non-electric benefits can be negative (i.e. increased maintenance or increased fossil fuel usage which results from a measure) and therefore are sometimes referred to as "non-electric impacts".
Non-Participant	A customer who is eligible to participate in a program, but does not. A non-participant may install a measure because of a program, but the installation of the measure is not through regular program channels; as a result, their actions are normally only detected through evaluations.
On-Peak kW	See Summer/Winter On-peak kW
Operating Hours	Hours that a piece of equipment is expected to be in operation, not necessarily at full load (typically expressed per year).

TERM	DESCRIPTION
PARIS	Planning And Reporting Information System, a statewide database maintained by the Department of Energy Resources (DOER) that emulates the program administrators' screening model. As a repository for quantitative data from plans, preliminary reports, and reports, PARIS generates information that includes funding sources, customer profiles, program participation, costs, savings, cost-effectiveness and program impact factors from evaluation studies. DOER developed PARIS in 2003 as a collaborative effort with the Department of Public Utilities and the electric program administrators. Beginning with the 2010 plans, PARIS holds data from gas program administrators.
Participant	A customer who installs a measure through regular program channels and receives any benefit (i.e. incentive) that is available through the program because of their participation. Free-riders are a subset of this group.
Prescriptive Measure	A prescriptive measure is generally offered by use of a prescriptive form with a prescribed incentive based on the parameters of the efficient equipment or practice.
Program Administrator (PA)	Those entities that oversee public benefit funds in the implementation of energy efficiency programs. This generally includes regulated utilities, other organizations chosen to implement such programs, and state energy offices. The Massachusetts electric PAs include Cape Light Compact, National Grid, NSTAR, Western Massachusetts Electric Company (WMECo), and Unitil. The Massachusetts natural gas PAs include Bay State Gas, Berkshire Gas, and New England Gas.
Realization Rate (RR)	The ratio of measure savings developed from impact evaluations to the estimated measure savings derived from the TRM savings algorithms. This factor is used to adjust the estimated savings when significant justification for such adjustment exists. The components of the realization rate are described in detail in the section on Impact Factors.
Retrofit	The replacement of a piece of equipment or device before the end of its useful or planned life for the purpose of achieving energy savings. "Retrofit" measures are sometimes referred to as "early retirement" when the removal of the old equipment is aggressively pursued.
Savings Persistence Factor (SPF)	Percentage of first-year energy or demand savings expected to persist over the life of the installed energy efficiency equipment. The SPF is developed by conducting surveys of installed equipment several years after installation to determine the operational capability of the equipment. In contrast, *measure persistence* takes into account business turnover, early retirement of installed equipment, and other reasons the installed equipment might be removed or discontinued. Measure persistence is generally incorporated as part of the measure life, and therefore is not included as a separate impact factor.
Seasonal Energy Efficiency Ratio (SEER)	A measurement of the efficiency of a central air conditioner over an entire season. In technical terms, SEER is a measure of equipment the total cooling of a central air conditioner or heat pump (in Btu) during the normal cooling season as compared to the total electric energy input (in watt-hours) consumed during the same period.
Seasonal Peak kW	See Summer/Winter Seasonal Peak kW, and Summer/Winter On-Peak Peak kW.
Sector	A system for grouping customers with similar characteristics. For the purpose of this manual, the sectors are Commercial and Industrial (C&I), Small Business, Residential, and Low Income.
Spillover Rate	The percentage of savings attributable to the program, but additional to the gross (tracked) savings of a program. Spillover includes the effects of (a) participants in the program who install additional energy efficient measures outside of the program as a result of hearing about the program and (b) non-participants who install or influence the installation of energy efficient measures as a result of being aware of the program.
Summer/Winter On-Peak kW	The average demand reduction during the summer/winter on-peak period. The summer on-peak period is 1pm-5pm on non-holiday weekdays in June, July and August; the winter on-peak period is 5pm-7pm on non-holiday weekdays in December and January.

TERM	DESCRIPTION
Summer/Winter Seasonal Peak kW	The demand reduction occurring when the actual, real-time hourly load for Monday through Friday on non-holidays, during the months of June, July, August, December, and January, as determined by the ISO, is equal to or greater than 90% of the most recent 50/50 system peak load forecast, as determined by the ISO, for the applicable summer or winter season.
Ton	Unit of measure for determining cooling capacity. One ton equals 12,000 Btu.
Watt	A unit of electrical power. Equal to 1/1000 of a kilowatt.

March 5, 2015	PAs provided informal database status report to Department

COMMENTS OF THE PROGRAM ADMINISTRATORS ON CUSTOMER CONFIDENTIALITY ISSUES ASSOCIATED WITH ENERGY PLATFORM'S CONCEPTUAL PROPOSAL

INTRODUCTION

On January 9, 2014, Energy Platforms, the database facilitator hired by the Energy Efficiency Advisory Council (the "EEAC"), circulated to stakeholders a revised conceptual proposal for a statewide energy efficiency database ("EP Proposal"). If adopted, this proposal would require the Program Administrators (or "PAs")[1] to export from their internal systems sensitive customer-specific account information that will be housed in the database and be accessible to non-PAs. As part of their evaluation of the EP Proposal, the Program Administrators analyzed the legal issues associated with disclosing such sensitive customer information. The PAs also reviewed their corporate policies regarding the dissemination of sensitive customer-specific account information. As the EEAC database process is to reconvene on April 4, 2014, with a focus on privacy, the PAs provide these comments for consideration in advance of those meetings.

As discussed below, the EP Proposal seeks disclosure of sensitive customer data that is strictly controlled by the PAs. Such sensitive data is accessible to the PAs' employees and contracted vendors only in the conduct of regulated PA business. Customer consent is required to disclose such sensitive data outside the conduct of regulated PA business.

DATA ELEMENTS IN EP PROPOSAL

Although the purpose for and the contents of the database have not been determined and discussions are ongoing, according to the EP Proposal, the database would contain customer-specific account information including, customer names, account numbers, rate class, location, usage and demand data, and project/measure level information, among other data (collectively "Customer Account Data").[2] EP Proposal at §§ 1.3.1, 2.2.2, 3.3, 4.3, 6. Energy Platforms states that Customer Account Data will be stored in a "secured access data 'Vault." EP Proposal at

[1] The Program Administrators include the following gas and electric distribution companies and a municipal aggregator: Bay State Gas Company d/b/a Columbia Gas of Massachusetts ("CMA"), The Berkshire Gas Company ("Berkshire"), Blackstone Gas Company, Boston Gas Company and Colonial Gas Company each d/b/a National Grid, Cape Light Compact ("Compact"), Fitchburg Gas & Electric Light Company d/b/a Unitil, Massachusetts Electric Company and Nantucket Electric Company each d/b/a National Grid, Liberty Utilities f/k/a New England Gas Company, NSTAR Electric Company and NSTAR Gas Company ("NSTAR"), and Western Massachusetts Electric Company ("WMECo").

[2] The Customer Account Data constitutes sensitive data that is strictly controlled by the PAs and requires customer consent prior to disclosure. In contrast, limited data such as customer name and address information or aggregate data that is combined in a manner that leaves individual customers unidentifiable is generally not considered sensitive, is not required to be under the same strict controls, and is not subject to the same customer consent requirements.

§§ 1.3.2, 2.2.3. The EP Proposal would allow "Data Consumers"[3] access to Customer Account Data "[t]o derive their own views of the source data as required subject to appropriate privacy protections." EP Proposal at § 1.2. Energy Platforms states that Customer Account Data will be protected and identifies privacy protection tools that could be used such as non-disclosure agreements, controlled access to the "Vault," access privileges to the database, and data aggregation. EP Proposal at §§ 1.3.6, 2.2.3, 3.3.

ANALYSIS OF PRIVACY AND SECURITY ISSUES

Giving third parties access to Customer Account Data raises serious concerns related to both privacy and security.[4] In those states that have squarely addressed the issue, disclosure of data sets such as Customer Account Data for a purpose unrelated to the conduct of regulated utility business requires customer consent.[5] Such consent is consistent with relevant federal privacy practices governing customer data access and privacy concerns and is central to healthcare industry privacy rules.[6] Absent consent, such disclosure could violate state privacy laws, leading to civil and criminal suits and potential penalties.[7] It could also violate privacy policies adopted by public utilities commissions and their regulated entities, resulting in civil liability and possible federal enforcement action.[8]

In Massachusetts, customer consent is necessary to permit third-party access to Customer Account Data outside the conduct of regulated PA business. Such sensitive data is accessible to the PAs' employees and contracted vendors only to the extent needed to carry out regulated PA business. As disclosure of Customer Account Data to a statewide database would serve no regulated PA business purpose, customer consent is required by Department of Public Utilities (the "Department") precedent as well as PA corporate policies and practices, which is consistent with how such information is treated in other states.[9] More importantly, absent consent,

3 The EP Proposal defines "Data Consumers" as including "regulators, consultants, stakeholders, and the public." EP Proposal at § 1.1.

4 For a general discussion of these issues, please refer to: State and Local Energy Efficiency Action Network. 2012. *A Regulator's Privacy Guide to Third-Party Data Access for Energy Efficiency*. Goldman, Lawrence Berkeley National Laboratory. http://www1.eere.energy.gov/seeaction/pdfs/cib_regulator_privacy_guide.pdf; Emerging Customer Privacy Issues, NARUC Summer Meeting (July 22, 2012) http://www.narucmeetings.org/Presentations/EmergingCustomerPrivacyIssues-Part1.pdf

5 See *A Regulator's Privacy Guide to Third-Party Data Access for Energy Efficiency* at § 3.

6 See id. at § 4 (discussing Fair Information Practice Principles (FIPPs), the Consumer Privacy Bill of Rights, FTC Codes of Conduct, non-binding industry standards, and a other emerging initiatives) and § 5.2 (discussing healthcare).

7 See id. at § 3.9.

8 See id. at §§ 2.2, 3, 4.1.3, 6.4.

9 See id. § 3.5 (also see Figure ES-1 and Table 2).

disclosure of such sensitive data could expose an individual PA, or the group of PAs, to liability under the Massachusetts Right to Privacy Act, M.G.L. c. 214, § 1B or Chapter 93A, and potentially other statutes.[10]

The Department has recognized the right to confidentiality of Customer Account Data, even in the context of promoting policies mandated by the Legislature. See 220 C.M.R. § 11.04; 220 C.M.R. § 14.03; Low Income Discount Rate Enrollment, D.T.E. 01-106-A at 11-12 (2003) (customer authorization in context of legislative directive to participate in low-income discount matching program); Competitive Market Initiatives, D.T.E. 01-54-A (2001) (customer authorization in context of legislative directive to develop competitive choice under Restructuring Act). In the absence of informed customer consent to public disclosure, the Department routinely grants motions for confidential treatment protecting from public disclosure Customer Account Data. See 2013-2015 Energy Efficiency Plan, D.P.U. 12-100 through D.P.U. 12-111, Hearing Officer Ruling (February 3, 2014) (granting motion dated December 20, 2012); Bay State Gas Company, D.T.E. 06-36, Hearing Officer Ruling (January 18, 2007); East Northfield Water Company, D.P.U. 11-50, Hearing Officer Ruling (March 19, 2012) (granting motion dated January 18, 2012).

Safeguarding the confidentiality of Customer Account Data is not only a legal obligation, but an important corporate responsibility for the PAs. Each of the PAs maintains physical, electronic, and procedural safeguards to protect Customer Account Data. Each PA has also adopted corporate privacy policies that require Customer Account Data to be protected and disclosed without customer consent only in the conduct of its regulated business. See, e.g., NSTAR's Privacy Policy;[11] WMECO's Privacy Policy;[12] Berkshire's Privacy Policy;[13] CMA's Privacy Statement.[14] For example, in the course of conducting their regulated business, the PAs disclose Customer Account Data without customer consent to their vendors, who must meet certain privacy, insurance, and security requirements in order to receive Customer Account Data. The contractual terms and conditions imposed on PA vendors require them to, among other things, indemnify the PAs, employ industry standard data system security measures and maintain certain types and levels of insurance. See Appendix A for sample terms and conditions.

[10] See Commonwealth v. Augustine, MA SJC-11482 (February 18, 2014) (holding individual has reasonable expectation of privacy in his historical cell site location information given its capacity to track movements of user thus search warrant required). While the U.S. Supreme Court has not yet directly ruled on application of the Fourth Amendment's protection against unreasonable searches and seizure extending to utility records or energy usage data the Court has recognized, "that an individual's privacy in the home is 'the very core' of the Fourth Amendment." *A Regulator's Privacy Guide to Third-Party Data Access for Energy Efficiency* at § 4.2, n.83 citing Silverman v. United States, 365 U.S. 505 (1961).

[14] https://www.columbiagasma.com/en/about-us/privacy-statement.

The PAs' privacy policies reflect their legal obligations and are typical of utilities across the country that require customer consent for disclosure of Customer Account Data outside the conduct of their regulated business. See, e.g., California;[15] Vermont;[16] Minnesota.[17] In California, the public utility commission issued an order finding that utilities may disclose Customer Account Data, including energy usage, without customer consent only in the conduct of their regulated business.[18] All other purposes are considered secondary and require customer consent in order for Customer Account Data to be disclosed.[19] Similarly, in Vermont, the public service board issued an order finding that the statewide regulated energy efficiency utility, Vermont Energy Investment Corporation ("VEIC"), may use sensitive customer information such as energy usage data in the conduct of its regulated business.[20] Otherwise, VEIC, which operates under the name Efficiency Vermont, may not disclose customer or project-level information without customer consent.[21]

Providing Customer Account Data to a statewide database is not permissible without customer consent because it would serve no regulated PA business purpose. The purpose of the statewide database outlined in the EP Proposal is to facilitate third-party access to energy efficiency data for general analysis. As discussed above, the PAs' vendors are not allowed such open-ended access to sensitive customer data. Instead, in order to receive Customer Account Data, they agree to be bound by strict contractual terms and conditions and may use the information only for the regulated business purposes outlined in the contract. Customers have a reasonable expectation of privacy in their Customer Account Data and, particularly, their energy usage information, which provides insight into their behavior. They have the legal right to choose whether to disclose Customer Account Data for the purpose of a statewide database.

The PAs provide Customer Account Data to the Department, as requested and necessary to support Department filings. It is legally permissible to provide this information because the

21 Id.; Investigation into Petition Filed by Vermont Department of Public Service Re: Energy Efficiency Utility Structure- Phase 2, Docket No. 7466, Vermont Public Service Board at 32-35 (2010). http://psb.vermont.gov/sites/psb/files/orders/2010/7466OrderRePhase2Issues.pdf.

Department has express statutory authority both over the PAs and to protect confidential information.[22] The state agencies who are members of the EEAC have no such statutory authority either over the PAs or to protect confidential information.[23] Moreover, they are bound by the Massachusetts Public Records Law, G.L. c. 66, which considers any information provided to a public agency or official a public record that must be disclosed upon request.[24] Even assuming *arguendo* that it was legal to provide Customer Account Data to state agencies other than the Department, they would bear little or no liability for a data breach if they disclosed such information, potentially leaving the PAs' liable. Compare G.L. c. 258, § 2 with Appendix A.

CONCLUSION

Absent customer consent, the PAs cannot legally provide Customer Account Data to a statewide energy efficiency database. In Massachusetts, customers, not the PAs, retain authority to decide whether to allow disclosure of their Customer Account Data to third parties for purposes outside the conduct of the PAs' regulated business. Customers may not want to disclose Customer Account Data for a variety of personal or business reasons, including concerns of privacy or potential competitive disadvantage. Obtaining customer consent for the release of Customer Account Data to third parties for a purpose outside the conduct of regulated PA business is a recognized practice and an appropriate safeguard against taking action that could

[22] See G.L. c. 164 § 76 (Department supervisory authority); G.L. c. 25, §§ 19, 21-22 (Department has final administrative review of energy efficiency determinations); M.G.L. c. 25, § 5D (expressly excludes from definition of public records, "trade secrets, confidential, competitively sensitive or other proprietary information" provided to Department during its regulatory proceedings).

[23] For example, the Department of Energy Resources ("DOER") has authority to collect and protect certain limited energy supply information under G.L. c. 25A, § 7, which does not include Customer Account Data. The Compact, however, has authority to protect customer data from disclosure pursuant to G.L. c 4, § 7(26)(s). That statute provides in relevant part: "trade secrets or confidential, competitively-sensitive or other proprietary information provided in the course of activities conducted by a governmental body as an energy supplier under a license granted by the department of public utilities pursuant to section 1F of chapter 164, in the course of activities conducted as a municipal aggregator under section 134 of said chapter 164 or in the course of activities conducted by a cooperative consisting of governmental entities organized pursuant to section 136 of said chapter 164, when such governmental body, municipal aggregator or cooperative determines that such disclosure will adversely affect its ability to conduct business in relation to other entities making, selling or distributing electric power and energy; provided, however, that this subclause shall not exempt a public entity from disclosure required of a private entity so licensed."

[24] Public records must, upon request, be made available for public inspection, unless the custodian of the records can show that it is specifically exempt from mandatory disclosure under one or more statutory exemptions. M.G.L. c. 66, § 10(c). Although M.G.L. c. 4, § 7, cl. 26(c) prohibits the disclosure of any information that may result in an unwarranted invasion of privacy, it is no guarantee against public disclosure. Determinations under the statute are made on a case-by-case basis and depend on balancing the public's right to know about the subject data against the severity of the intrusion of privacy. See Attorney Gen. v. Sch. Comm. of Northampton, 375 Mass. 127, 131-32 (1978) (requiring showing of privacy exemption for each individual application rather than group of applicants); Torres v. Attorney Gen., 391 Mass. 1, 9 (1984); Massachusetts Supervisor of Public Records Determination Letter, SPR10/150 (Aug. 16, 2010) (finding that DOER was required to disclose names and addresses of people who secured reservations for rebates under MassSave Great Appliance Exchange).

erode customer confidence, reflect poorly on energy efficiency programs, discourage participation or produce other unintended consequences.

As the statewide database discussions resume, the PAs are happy to discuss how aggregate data that is combined in a manner that leaves individual customers unidentifiable may be an alternative source of information for a statewide database. Disclosure of such aggregate data would reduce the privacy risks to customers while still enabling analysis of trends.[25] A better delineation of the specific purpose of third-party access to energy efficiency data (aside from generic data analysis) would facilitate such a discussion.

If the final specifications for a statewide database require the inclusion or disclosure of Customer Account Data, the PAs will not be able to comply without an Order from the Department permitting them to do so. The Department is in the best position to determine the legal and privacy issues associated with disclosing Customer Account Data to third parties and is currently exploring customer privacy issues in open dockets.[26] A proceeding at the Department would allow for a comprehensive discussion of customer privacy implications, including legal and practical constraints, data needs associated with specified purposes, data security standards, data breach liability, and other issues such as indemnification, insurance, and resources for making affected customers' whole in the event of a data breach, all of which are legitimate PA concerns given recent examples of data breaches.

[25] See *A Regulator's Privacy Guide to Third-Party Data Access for Energy Efficiency* at viii, §§ 2.3.3, 3.6, 6.2; see also supra nn. 15-17 (allowing disclosure of certain aggregate data); http://ecdms.energy.ca.gov/ (California consumption data is aggregated and available by county).

[26] There was a panel hearing on privacy in Grid Modernization, D.P.U. 12-76, on February 27, 2014. The Department has also opened a docket on cybersecurity and held a technical session on February 14, 2014.

APPENDIX A – SAMPLE PA TERMS AND CONDITIONS

(In the sample terms and conditions below "Owner" means the PA)

INSURANCE.

Consultant shall provide the following coverages to meet Owner's insurance requirements:

(a) Commercial General Liability in the amount of $x,000,000 per occurrence.

(b) Business Auto Coverage with a $x,000,000 each accident limit and shall include owned, non-owned, leased and hired vehicle coverage.

(c) Workers' Compensation, including the following: Statutory Coverage applicable in the State where the Services are performed and Employers Liability Coverage "B" (or stop gap coverage), in the amount of $x,000,000.

(d) Professional Liability Insurance with a combined single limit of not less than $x,000,000 per occurrence.

(e) Cyber Insurance in the amount of $x,000,000 per occurrence depending on context.

(f) Before any Services begin, Consultant must furnish properly executed certificates of insurance and endorsements naming Owner as an additional insured on Consultant's Commercial General Liability policy. An authorized representative of the insurance company shall execute the foregoing. Additional insured means, naming Owner as an insured under the liability coverages with respect to the Services under the Agreement and providing that such insurance is primary and non-contributory to any liability insurances covered by Owner.

(g) Consultant shall directly provide to Owner notices of non-renewal and/or cancellation and/or reduction in limits or material change in any of the required coverages within (7) days of receipt of such notices.

(h) Consultant shall fully comply with all state and federal requirements applying to this insurance in the states where the Services are performed with a waiver of subrogation in favor of Owner. Whenever Consultant shall have Owner's property in its possession for Consultant's fabrication or otherwise as herein required, Consultant shall be deemed the insurer thereof and shall be responsible for such property until its return to and acceptance by Owner.

CONFIDENTIAL INFORMATION.

"CONFIDENTIAL INFORMATION" means any and all data, documentation, methods, processes, materials, and all other information relating to the past, present and future business of Owner and its Affiliates. Confidential Information also includes all information owned by customers, suppliers or other third parties to whom Owner or its Affiliates owe an obligation of confidentiality. Confidential Information also includes all Work Product. Confidential Information does not include any information that is publicly available or becomes publicly available through no breach of this Agreement or other Confidentiality Agreement by Consultant, its Subcontractors or its employees or information that Consultant can show, by written records, was known to Consultant prior to the date of this Agreement.

(a) Consultant's Obligations with respect to all Confidential Information

1. During the term of this Agreement and thereafter, except as Owner may authorize in writing, Consultant shall and shall cause its employees and Subcontractors to: (i) treat and cause to be treated as confidential all Confidential Information; (ii) not disclose any Confidential Information to any third party or make available any reports, recommendations, extracts, summaries, analysis or conclusions based on the Confidential Information; (iii) reveal the Confidential Information only to those employees of Consultant who require such access in order to perform the Services hereunder; (iv) grant access to Confidential Information only to employees of Consultant or Subcontractors who have signed a confidentiality agreement if required by Owner; (v) use or grant access to Confidential Information only in connection with the performance of Services pursuant to this Agreement; (vi) make copies of any tangible embodiment of Confidential Information only as necessary for the performance of such Services; (vii) remove any tangible embodiment of Confidential Information from the premises of Owner only with the express written permission of Owner; and (viii) maintain policies and procedures and comply with all applicable laws and regulations to detect, prevent and mitigate the risk of loss, unauthorized access, use, modification, destruction or disclosure of Owner's and its Affiliates' Confidential Information.

2. Consultant may disclose only such Confidential Information as is necessary to comply with a regulatory, legal, or governmental request and only after providing immediate notification to Owner allowing sufficient time for Owner to seek a protective or limiting order or otherwise prohibiting the disclosure of the requested Confidential Information as Owner deems necessary in its sole discretion. Consultant shall act in good faith to assist Owner where appropriate with respect to Owner's efforts to seek a protective order or order limiting disclosure.

3. In performing the Services, at a minimum, Consultant and its Subcontractors shall employ industry standard data and system security measures for securing Confidential Information so as to reasonably ensure that Confidential Information is not lost or stolen, or otherwise used, modified or accessed, attempted to be accessed, or allow access to any third party without Owner's prior express written approval or by any Consultant employee or agent who is not authorized to access the Confidential Information. Consultant and its Subcontractors shall upon discovery of any breach of security or unauthorized access, immediately: (i) notify Owner of any loss or unauthorized disclosure, possession, use or modification of the Confidential Information or any suspected attempt at such activity or breach of Consultant's or its Subcontractors' security measures, by any person or entity; (ii) investigate and take corrective action in response thereto; and (iii) provide assurance to Owner's reasonable satisfaction that such activities or breach or potential breach shall not reoccur.

4. While at Owner's or its Affiliate's facilities or using Owner's or its Affiliate's equipment or accessing Owner's or its Affiliate's systems (including telephone systems, electronic mail systems, and computer systems) Consultant, its Subcontractors and their respective personnel shall observe and follow all applicable Owner or Affiliate policies and standards, including those policies relating to security of and access to Confidential Information as such policies and standards are modified and supplemented from time to time. Applicable policies will be made available upon request.

5. Upon termination of this Agreement or applicable Purchase Order, Consultant and its Subcontractors, at Owner's discretion, shall either return the Confidential Information to Owner or comply with the following minimum standards regarding the proper disposal of Confidential Information: (i) implement and monitor compliance with policies and procedures that prohibit unauthorized access to, acquisition of, or use of Confidential Information during the collection, transportation and disposal of Confidential Information; (ii) paper documents containing Confidential Information shall be either redacted, burned, pulverized or shredded so that Confidential Information cannot practicably be read or reconstructed; and (iii) electronic media and other non-paper media containing Confidential Information shall be destroyed or erased so that Confidential Information cannot practicably be read or reconstructed.

(b) Consultant's Additional Obligations with respect to Personal Information

1. Personal Information is a subset of Confidential Information and includes any information that identifies a person (e.g., name in combination with any of the following: social security number; driver license number; state identification number; credit or debit card account number; bank account number; or other financial account number) who is a former, current or prospective customer, employee or shareholder of the Owner or any of its Affiliates. With respect to the protection of and access to Personal Information, Consultant and its Subcontractors shall comply with all applicable laws regarding Personal Information.

2. If Consultant or its Subcontractors store or maintain Personal Information, Consultant and its Subcontractors, as applicable, shall employ industry standard systems and practices with respect to: (i) intrusion detection systems including actively monitoring such systems for signatures that correspond to attempts at breaking the security of Personal Information; and (ii) backup procedures relating to software, system configurations and Personal Information.

3. To the extent Consultant or its Subcontractors has access to or uses Personal Information in the performance of its Services for Owner or any of its Affiliates and such Personal Information contains personal information of residents of the Commonwealth of Massachusetts, Consultant shall comply with the requirements of 201 CMR 17.00: Standards for the Protection of Personal Information of Residents of the Commonwealth, as currently promulgated or subsequently amended. A current copy of 201 CMR 17.00 will be provided upon Consultant's request.

(c) Consultant's Additional Obligations with respect to Federal Red Flag Obligations. If Consultant or its Subcontractors provision of Services involves the processing of Personal Information so as to place Consultant or its Subcontractors in a position to observe indicators of identify theft (e.g. consumer fraud alerts, notifications or warnings; suspicious documents, personal identification information, or activity; or notice from customers, law enforcement or others regarding identity theft), Consultant and its Subcontractors shall: (i) maintain policies and procedures to identify, detect and respond to Red Flags, substantially in accordance with Owner's program regarding such Red Flags, as updated from time to time, a current copy of which will be made available upon request, (ii) report the detection of any such Red Flags to Owner; and (iii) take appropriate measures to prevent or mitigate the risk of identify theft that may arise in the performance of such Services.

(d) Irreparable Harm. Consultant acknowledges that the breach of any of the covenants contained in this Article will result in irreparable harm and continuing damages to Owner and Owner's business, and that Owner's remedy at law for any such breach or threatened breach would be inadequate. Accordingly, in addition to such remedies as may be available to Owner at law or in equity in the event of any such breach, any court of competent jurisdiction may issue an injunction (both preliminary and permanent), without bond, enjoining and restricting the breach or threatened breach of any such covenant, including an injunction restraining Consultant from disclosing, in whole or in part, any Confidential

Information. Consultant shall pay all of Owner's costs and expenses, including reasonable attorneys' fees and accountants' fees, incurred in enforcing such covenants.

(e) By executing this Agreement, Consultant acknowledges and agrees to comply with the foregoing and will provide further evidence of such compliance upon Owner's request. The obligations of this Article shall survive any termination of this Agreement.

INDEMNIFICATION.

(a) To the fullest extent permitted by law, Consultant waives any right of contribution and agrees to indemnify, defend and hold harmless Owner and its parent company, agents, affiliates and employees (collectively, "Indemnitees") from and against all claims, damages, losses, fines, penalties and expenses, including attorneys' fees, related in any way to (i) any breach of this Agreement by Consultant; or (ii) Consultant's or its Subcontractors' or agents' performance of the Work (collectively, "Claims"), provided that any such Claims in subsection (a)(ii) above are caused in whole or in part by any negligent act or omission of Consultant, any Subcontractor or any of its respective direct or indirect employees or agents for whose acts any of them may be liable. Such obligation shall not negate, abridge, or otherwise reduce any other right or obligation of indemnity or contribution in favor of the Indemnitees. Such obligation to indemnify, defend and hold harmless shall not be limited in any way by any limitation on the amount or type of damages, compensation, benefits or insurance proceeds payable by, for or to Consultant or anyone directly or indirectly employed by Consultant. The obligations of Consultant under this Agreement shall not extend to the liability of the Indemnitees arising out of the Indemnitees' sole negligence. Consultant shall impose identical indemnification, defense and hold harmless obligations upon all Subcontractors.

(b) To the fullest extent permitted by law, Consultant expressly (i) waives the benefit, for itself and all Subcontractors, insofar as the indemnification, defense and hold harmless obligations of Indemnitees are concerned, of the provisions of any applicable workers' compensation law limiting the tort or other liability of any employer on account of injuries to the employer's employees, and (ii) assumes liability in accordance with this Article.

(c) Consultant agrees to perform all required Work under this Agreement, including disposition of resulting waste products, in compliance with all applicable federal, state, and local environmental and safety laws, regulations, and ordinances**,** including the Occupational Safety and Health Act and applicable regulations. To the fullest extent permitted by law, Consultant agrees to indemnify, defend and hold harmless Indemnitees from any claims made or asserted against same arising out of or related to such Work and alleging a failure to comply with any such environmental requirements, including any and all judgments, monetary penalties or fines directed against Indemnitees as a result of Consultant's performance of the Work, including attorney's fees and expenses incurred by Indemnitees in any litigation or regulatory action arising out of such Work.

(d) Indemnitees shall have the right (but not the obligation) to defend any Claim for which they are indemnified by Consultant or Subcontractor hereunder and, in the event Indemnitees elect to exercise such right to defend themselves, shall be entitled to select counsel of its choice to conduct such defense and to be reimbursed by Consultant for the reasonable costs and expenses of such counsel; provided that the Indemnitees shall not settle such claim or cause of action prior to obtaining the written consent of Consultant. In the event Indemnitees elect not to defend any such Claim, Consultant shall have the right to defend and settle such Claim in the name and stead of Indemnitees and in its own name, and to select counsel of its choice to represent itself and Indemnitees together or alone, whichever the case may be; provided that Consultant shall not settle such Claim or cause of action prior to obtaining the written consent of the Indemnitees; and provided further that if there is an actual or potential conflict of interest between Indemnitees and Consultant with respect to any such Claim, such that counsel selected by Consultant cannot represent both the Indemnitees and Consultant without waivers of such conflict, then Consultant shall pay the reasonable costs and expenses of the Indemnitees' separate legal representation, in addition to the cost of counsel selected by Consultant. Indemnitees shall give notice to Consultant of its election whether to defend any such claim or cause of action.

(e) Consultant shall indemnify, defend and hold Indemnitees harmless from and against any claim, expense, fine, levy, penalty or liability of any kind sought to be imposed on Owner by any governmental authority or person as a result of Consultant or Subcontractor's failure to comply with regulations pertaining to anti-drug and alcohol testing programs and operator qualification programs. Consultant further agrees to indemnify, defend and hold Indemnitees harmless from and against any costs, including reasonable attorneys' fees, incurred by Indemnitees in the course of any litigation or regulatory action arising out of noncompliance with such programs and regulations.

(f) Consultant's indemnification obligations set forth in paragraphs (c), (d) and (e) above are in addition to, and in no way shall be a limitation of, Consultant's indemnification obligations set forth in paragraph (a) above.

(g) Consultant's obligations under this Article shall survive any termination of the Agreement, the Work, or any Purchase Order for a specific Project.

Mr. Mark Marini, Secretary
Department of Public Utilities
One South Station, Fifth Floor
Boston, Massachusetts 02110

Re: Resolution of the Energy Efficiency Advisory Council Concerning the Statewide Database Request to the Department of Public Utilities dated May 13, 2014.

Dear Secretary Marini:

Enclosed please find the Resolution of the Energy Efficiency Advisory Council ("EEAC", "Council") with respect to certain capabilities and access requirements that a Statewide Energy Efficiency Database may have upon implementation. Pursuant to the Department of Public Utilities ("Department") Order approving each of the Program Administrator's Three-Year Energy Efficiency Investment Plans for 2013 through 2015, D.P.U. 12-100 through D.P.U. 12-111, the Department ruled that the development of a statewide database is consistent with, and complementary to, the revised reporting protocols previously established in D.P.U. 11-120-A, Phase II. The Department further stated that it would participate in the development of the statewide database process. In that Order, the Department also acknowledged that the Department of Energy Resources ("DOER") would assume a leadership role in the development of the database. See Order, p.60.

In its capacity as Chair of the Council, the DOER obtained the consent of the Council to establish a Database Subcommittee. The Database Subcommittee, in turn, created a Database Working Group. Working in tandem, these two bodies have advanced the goal of developing a Statewide Energy Efficiency Database. Their good work has resulted in a clarification of certain issues upon which there is not currently a consensus.

The enclosed Resolution of the Council passed on May 13, 2014 represents a request for guidance from the Department by the Council. As Chair of the Council, the Massachusetts

Department of Energy Resources ("DOER") submits this Resolution of the EEAC to the Department of Public Utilities. The Voting Councilors of the EEAC approved the enclosed Resolution by a vote of thirteen in favor and zero against. Two Voting Councilors were not present for the vote.

On behalf of the Council, the DOER requests that the Department consider the enclosed Council Resolution and take the steps it deems appropriate to make a determination in response to the Council's request for guidance. The DOER thanks the Department for its participation in this process. We stand ready to assist the Department in our shared objective of realizing the Statewide Energy Efficiency Database.

Sincerely,

Steven I. Venezia
Deputy General Counsel

Enclosure

Massachusetts Energy Efficiency Advisory Council
Resolution on Statewide Database
Request to the Department of Public Utilities

The Energy Efficiency Advisory Council ("EEAC") has determined that designing, building, and implementing a statewide energy efficiency database ("Statewide Database") is a chief priority.

Accordingly, the EEAC created a database subcommittee to provide oversight on behalf of the EEAC for activities regarding the design, development, and implementation of a Statewide Database.

The Department of Public Utilities (**"**DPU**"**) recognized that the Department of Energy Resources (**"**DOER**"**) would assume a leadership role in developing a Statewide Database through a stakeholder process. Further, the DPU agreed to participate in the stakeholder process to ensure consistency between the development of the Statewide Database and future energy efficiency performance reports.

A *Massachusetts Statewide Energy Efficiency Database System Specification* and a *Massachusetts Statewide Energy Efficiency Database System Cost and Schedule Estimate* were completed pursuant to the EEAC Database Subcommittee process where there was not full consensus. see Appendix A).

At this time, to continue the development of the Statewide Database, the EEAC is requesting guidance from the DPU on two matters:

1. The EEAC hereby requests that the DPU with all deliberate speed identify the data inputs, required to inform the EEAC and the DPU in their respective mandates to oversee the pursuit of all cost-effective energy efficiency on a statewide basis, which include site, project, measure, and participant and non participant usage that shall be included in the Statewide Database.

If, in answering 1. above, the DPU identifies customer data to be included in the Statewide Database that the DPU deems subject to Massachusetts data privacy laws then:

2. The EEAC hereby requests that the DPU with all deliberate speed decide on the reporting schedules and recommended data privacy controls for:

    (a) Confidential, granular statewide energy efficiency and ratepayer usage data;

    (b) Publically viewable datasets, which will be derived from the data stored in the Statewide Database; and

    c) Responsibility for funding and hosting a Statewide Database containing confidential data.

X. **Responses and Roadmap to Department's Additional Filing Requirements**

2016-2018 Three-Year Energy Efficiency Plans
Additional Filing Requirements

1. Provide pre-filed testimony describing the development and determination of the proposed statewide and Program Administrator-specific savings goals. Explain how technical potential studies and other sources were used in this regard, and provide copies of all statewide and Program Administrator-specific technical potential studies and other sources that were used.

Response:

Please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition), and Studies of Remaining Potential included in Appendix M of this Plan. Additionally, please see Section IV.A of the Plan for additional information on development of goals.

2. Incorporate the following information into the D.P.U. 08-50 tables, by core initiative, providing actual and estimated values for plan years 2013-2015,[1] and planned values for plan years 2016-2018:[2]

a. Savings Tables 1 through 4: savings per total resource cost ("TRC") (i.e., electric savings (megawatt-hour ("MWh")/$ spent), gas savings (therms/$ spent), and oil savings (million British Thermal Units ("MMBtu")/$ spent));

b. Savings Tables 1 through 4: savings per participant per TRC (i.e., electric annual savings MWh/participant/$ spent; gas annual savings therms/participant/$ spent; oil annual savings mmBTU/participant/$ spent);

c. Benefits Tables 1 though 4: resource benefits per program cost;

d. Benefits Tables 1 through 4: resource benefits per TRC;

e. Benefits Tables 1 through 4: resource benefits per participant per TRC (i.e., total resource benefits/participant/$ spent);

f. Savings Tables 1 through 4: average percent savings (i.e., annual reduction vs. previous year billed usage) applicable to direct incentive (or downstream) core initiatives where Program Administrators have information on participant energy usage; and

g. Savings Tables 1 through 4: same-year load-weighted participation by program by meter (percent of eligible customer load participating in at least one direct incentive program).

Response:

For responses to parts (a) through (e), please see the "Elec/Gas Add. Filing Reqs" tab of the Energy Efficiency Data Tables, filed individually by PAs as Exhibit 4 to each PA's Petition, and aggregated statewide in Appendix C to this Plan. PAs included the additional materials required under this question all on one tab in order to assist in review and to keep other tables consistent with past filings.

f. The PAs cannot provide average percent savings per core initiative. The definitions of participants, available in Appendix P, show that a single customer class can be a participant in multiple core initiatives within a program and sector. Core initiatives were not designed to be offered exclusively to specific customers or rate classes, so usage cannot be isolated or allocated per core initiative. Therefore, in attempting to make this calculation, the denominator (usage) for most core initiatives would overlap with other core initiatives, and would not provide data that could tie to any specific core initiative.

---

[1] Where in these additional filing requirements data are sought for program years 2013-2014, file actual values; for program year 2015, file the most up-to-date actual values available.

[2] The Department recognizes the complexities involved in evaluating program participation. In providing the requested information, the Program Administrators should explain how participation is estimated and define what constitutes a "participant."

Additionally, due to numerous factors, including, but not limited to, varying weather conditions, timing of when savings occurred, and economic conditions, the PAs suggest that it is not useful or meaningful to compare savings to the previous year's billed usage without a detailed accounting for other factors through rigorous evaluation.

PAs have sought to understand how participation in the PA programs affects energy usage through EM&V. During the evaluation of PA measures and/or core initiatives, the evaluation team has employed the type of analysis raised in this question, commonly referred to as a billing analysis. This analysis seeks to isolate the impact that program-supported energy efficiency measures will have on controlled pre/post measurement of usage. The pre/post measurement must control for weather, economic conditions, facility sizing, operational changes, changes in occupancy, and manufacturing cycles, as well as many other variables that can significantly change usage from one year to the next. Changes in usage may or may not be due to the installation of program-supported energy efficiency measures; without taking steps to both annualize and weather normalize savings data, and isolate various other factors, it is not possible to determine with any confidence that changes in individual usage were related to a program or measure's savings. Conducting this analysis for every core initiative would be a multi-stage, lengthy, and expensive undertaking, and would be redundant to the evaluation billing analysis that has been completed through the evaluation studies.

The PAs recognize the importance of understanding how, over time, customers are participating across programs. Through the statewide EM&V process, the PAs research and seek to understand participation through market assessment evaluations, such as the customer profile studies. The goal of these studies is to aggregate statewide data by PA, market sector, and premise in order to better understand participation across the statewide programs.

For further information on the Customer Profile Studies, please see Appendix T (evaluation summaries) and Appendix U (evaluation studies).

g. As stated in the response to Question 2f above, because core initiatives were not designed to be offered exclusively to specific customers or rate classes, load or usage cannot be isolated or allocated per core initiative as most core initiatives overlap with other core initiatives. In order to provide information to help reach the intent of the question, the PAs have provided data at the sector-level for 2013 and 2014, the years in which PAs have data from the Customer Profile Studies.

The percent of eligible customer load participating in at least one direct incentive program can be shown through the results from the C&I and Residential Customer Profile Studies. The C&I Customer Profile study includes preliminary results from 2013 and 2014, while the Residential Customer Profile study includes preliminary results from 2013. Data for 2015 is not available through either customer profile study at this time. For 2016-2018, the Program Administrators only have planned participation and forecasted load. Therefore, there are no accounts to tie usage to.

Table 2-1 below shows Residential and Low-Income participant usage (not including the behavioral and upstream initiatives) as a percent of total usage by PA. This table was provided by the evaluation contractor who aggregated data at the premise level to support the Residential Customer Profile Study completed in October of 2015. Because it was the first time that this type of study was completed in the residential sector and took longer than expected to complete, this data is only available for 2013. The PAs anticipate doing a similar study to include additional years of data in the future; the PAs currently have an open RFP for residential evaluation work, which is expected to include the residential customer profile study going forward. Please see Table 2-1 below for residential and low-income weighted participation rates by PA and statewide.

Table 2-1: Residential & Low-Income Weighted Participation Rates

Fuel Type	Program Administrator	2013
Electric	Cape Light Compact	7.6%
	Eversource	6.2%
	National Grid	8.3%
	Unitil	4.3%
	Statewide	**7.3%**
Gas	Berkshire Gas	4.6%
	Columbia gas	4.7%
	Eversource	6.4%
	Liberty Utilities	2.0%
	National Grid	7.0%
	Unitil	2.5%
	Statewide	**6.1%**

Table 2-2 below shows C&I usage as a percent of total usage by PA. Data is provided separately for 2013 and 2014. The C&I Customer Profile Study for 2014 is currently underway, and past year information is refreshed with each updated study, so both the 2013 and 2014 data is preliminary. Please note that the majority of upstream lighting data is not included in Table 2-2, since these customers could not necessarily be linked to individual billing accounts. This causes the consumption-weighted participation rates to be underestimated for all electric PAs. Further, not all non-upstream participant accounts could be matched with billing account information. For the gas programs, the statewide merge success rate of tracking to billing account information is 85% for 2014. For the electric programs, the statewide merge success rate for 2014 is 36% when the upstream data is included, and 87% when upstream data is not included. Please see Table 2-2 below for C&I weighted participation rates by PA and statewide.

Table 2-2: C&I Weighted Participation Rates			
Fuel Type	**Program Administrator**	**2013**	**2014**
Electric	Cape Light Compact	40.1%	38.7%
	Eversource	49.5%	50.5%
	National Grid	46.6%	45.4%
	Unitil	52.9%	55.1%
	Statewide	**48.0%**	**48.0%**
Gas	Berkshire Gas	18.8%	16.1%
	Columbia gas	18.6%	15.8%
	Eversource	22.1%	19.2%
	Liberty Utilities	29.0%	33.5%
	National Grid	29.2%	25.4%
	Unitil	22.0%	19.9%
	Statewide	**25.6%**	**24.3%**

3. Provide the following information for program years 2013 through 2015. Include pre-filed testimony describing how the Program Administrators used this (and other) information to address participation barriers and achieve deeper participant savings:

a. market sector participation rates in the commercial and industrial ("C&I") energy efficiency programs (e.g., municipal, healthcare, real estate, education, non-profits, hospitality, and small and mid-sized C&I);

b. total number and percentage of new and repeat participants (i.e., participants that participated in at least one direct incentive program over the previous three-year period) by core initiative;

c. percentage of savings associated with new participants and repeat participants by core initiative;

d. total number and percentage of customers participating in multiple core initiatives over the past three years by customer class and/or sector;

e. percentage of participants receiving HEAT loans versus total participants installing HEAT-loan eligible measures;

f. Home Energy Services ("HES") close rate (i.e., percentage of residences that received a retrofit following a home energy assessment, regardless of the number of efficiency measures installed) and savings and associated budget from measures installed under the C&I direct install core initiative compared to the total measures recommended but not installed; and

g. (electric only) percentage of HES oil heating participants receiving either weatherization or heating system upgrades.

Response:

For information on how the PAs use the information requested in this question to address participation barriers and achieve deeper participant savings, please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition) and the information set forth below.

The PAs use a variety of data sources to evaluate program participation, address participation barriers, and achieve deeper participant savings. The PAs, however, do not use the data in the form expressly as requested in Question 3 of the Department's Additional Filing Requirements to evaluate or project program participation. Valuable sources of information for participant data are the Residential and C&I Customer Profile Studies that the Program Administrators completed in advance of the 2016-2018 Plan. See Appendix U, Study 9; 2014 Energy Efficiency Plan-Year Reports, D.P.U. 15-49, Appendix 4D, Study 14-25.[3] The Residential and C&I Customer Profile Studies, expected to be completed annually going forward, analyze the PAs' billing and tracking data to provide greater insights into the population and participation trends

[3] The C&I Customer Profile Study for 2014 is currently underway.

characterizing the PAs' energy efficiency programs in the Commonwealth. The PAs have used these studies to understand participation and to respond to certain requests for information in the Department's Additional Filing Requirements memorandum.

The Residential and C&I Customer Profile Studies were designed to help streamline and gain insight into the impact that energy efficiency programs are having in Massachusetts across all PAs, electric and gas, in a holistic way. The advantage of this aggregated method is the ability to view data for the Commonwealth as a whole. This study can be used in conjunction with other, more PA-specific segmentation and customer strategies to help understand participation and design programs and "go to market" strategies to achieve greater energy savings and increase program participation. One primary drawback of these studies, however, is that (like other evaluations), there is a time lag between participation and when data analysis is available. The C&I Customer Profile Study includes preliminary results for 2013 and 2014, while the Residential Customer Profile Study includes preliminary results for 2013. The PAs expect to continue work on customer profile studies during the Plan term in order to continue gaining insight into the PAs' customers and their participation in the programs.

The profile studies provide many distinct insights that allow PAs to:

- **Examine changes over time.** While the first Residential Profile study has recently been completed, the C&I Evaluation Database, prepared to support the C&I Profile Study, is populated with four years of consistent, standardized PA billing and tracking data. This data is updated and cleaned each year to support reliable, up-to-date comparisons of program participation and savings over time (*e.g.*, savings achieved by the Healthcare segment between 2011 and 2014).
- **Ensure confidentiality.** The annual Customer Profile Studies, performed by third-party contractors, preserve PAs' customer confidentiality utilizing robust IT system controls, while allowing PAs to evaluate how their standardized data compares to the standardized data for other PAs and the state as a whole.
- **Pinpoint savings opportunities.** PAs plan to supplement billing and tracking data with GIS libraries and tax assessor data to identify and target specific areas and customers with high savings potential. For example, Figure 2 from the 2014 C&I Customer Profile study shows that the Accommodation and Food Service sector had consistently higher energy use intensities ("EUIs") on Cape Cod than in any other region of Massachusetts. See 2014 Energy Efficiency Plan-Year Reports, D.P.U. 15-49, Appendix 4D, Study 14-25. This may represent an opportunity for account-level targeting for efficiency measures, or a more blanketed marketing push.
- **Efficiently identify and analyze research questions.** The annual Customer Profile Studies identify key researchable questions for subsequent study, and the C&I Evaluation Database provides a common collection and storage point for data that can be leveraged across all non-residential evaluation activities, including impact evaluations, market assessments, and process evaluations. Using a common data source also ensures consistency and comparability across studies.

Market Sector Participation Rates

The Customer Profile Studies are used to help improve PAs' understanding of markets, including the C&I markets. Evaluation, such as the Customer Profile Studies, is used to enhance the implementation process. Through implementation, PAs address participant barriers and formulate strategies to obtain deeper and broader savings. PAs employ implementation strategies that are specific to their service territory and size. Many of these strategies in C&I are based on customer engagement; Program Administrators have developed relationships over time with customers, and engage directly with those customers to learn about barriers and provide solutions. Thus, while quantitative data such as market segment participation rates help PAs see trends and find areas on which to focus, PAs use qualitative work with customer engagement and implementation strategies to address participation barriers and achieve deeper participant savings.

New and Repeat Customers

For the majority of core initiatives, the PAs do not use the data requested by the Department on new and repeat customers to address participation barriers or achieve deeper savings. Rather, the PAs address these barriers and goals through program design strategies. In the residential sector, the programs are designed to address participation barriers and achieve deeper savings by offering assessments at no cost to the customer, installing instant savings measures, offering special incentives to help customers overcome low-cost pre-weatherization barriers, incentivizing comprehensive weatherization opportunities, providing downstream rebates on a variety of products, and offering interest-free financing. The goal of these initiatives is to realize deep savings per participant in as few visits to a customer's home as possible, as it is costly to pay for repeat assessments, with diminishing returns on savings opportunities. The data provided does show a low percentage of repeat customers during the term. Most repeat participation in the residential direct install programs shown in the data tables is caused by participation that crosses over from one year to the next, when assessments and installations do not occur in the same calendar year.

The upstream programs are designed to have a broader reach and higher participation rates, as well as greater repeat participation in a core initiative, such as Residential Lighting. Because this core initiative is upstream and not tied to accounts, however, the PAs can only estimate, through the use of evaluation studies, the number of repeat customers.

As shown in the tables in response to questions 3b and 3c, the bulk of repeat participation occurs in the C&I sector, which is based on strategic planning with customers. These customers represent large portions of overall sales, and they typically are large enough to engage in multi-year or multi-phased projects. This PAs have found that in order to maintain high level sustainable energy savings on a portfolio basis, these customers must be engaged on a consistent basis. At the same time, as the customer spends dollars installing energy efficiency, the cost rises while the opportunity diminishes over time. Therefore, holding technological innovation constant, the all cost-effective savings opportunity will decline as the potential for high-savings projects with large repeat customers declines. In addition to very large customers, more moderately sized C&I customers may repeat participation as they may address one end use at a time in a facility, e.g., HVAC in year one and lighting in year two.

Customers Participating in Multiple Core Initiatives

In the Residential and Low-Income Whole House programs, comprehensive core initiatives are designed to treat different market segments and customer classes (*e.g.*, single or multi-family, new construction or retrofit), and therefore do not lend themselves to participation across multiple core initiatives. Customers participating in Whole House may also participate in one of the Residential Products program core initiatives, but many of these rebates (such as Residential Lighting) are offered upstream and are not tied to specific accounts, making it difficult to quantify the percentage of customers participating in multiple initiatives. Due to these reasons, the PAs do not use this data to address residential participation barriers and achieve deeper savings and cannot accurately calculate it where upstream initiatives are included.

While the Program Administrators did not expressly use the data requested on customers participating in multiple core initiatives to address participation barriers, PAs are constantly using information from evaluation studies, feedback from stakeholders, customers, and vendors to improve program offerings. Examples of additional enhancements and strategic targeted approaches included in this Plan are new efforts geared toward renters and moderate income customers, described further in Section III.E.3 and III.E.5 of this Plan.

C&I customers are more likely to participate across C&I core initiatives, but the PAs do not focus on this data to address participation barriers. This is because both the customer and the PA are focused on ensuring that the customer has the opportunity to explore all cost-effective energy efficiency projects at the facility, using whichever core initiatives are appropriate for that customer. Due to the broad range of projects available to a single customer under a single C&I core initiative, participation in one core initiative is not a good indicator that the customer has exhausted options to participate further in that core initiative, or that they are necessarily a good candidate to participate in a different core initiative. Participation in one core initiative does not provide the PA or the customer insight into other opportunities at the facility; insight is gained primarily through PA-customer engagement, where PAs learn about the customer needs, including which initiatives the customer has already pursued projects in, and what opportunities are still available.

HEAT Loan Participation Rate

HEAT Loan is an important tool that the PAs offer to overcome a barrier that some residential customers may face in investing in energy efficiency improvements. The financing of nearly $300 million of HEAT Loans to residential customers has been one of the critical steps in achieving a higher adoption of deeper saving measures in the PA programs. Thus, while the PAs do not typically use the calculations requested by the Department for planning purposes (such as addressing participation barriers and achieving deeper savings), HEAT Loan is a critical piece to the residential portfolio's planning process. PAs analyze historical expenditures on HEAT Loan, along with expected changes in the number and cost of eligible measures and participants, as the primary considerations for planning purposes. The HEAT Loan expenditures exceeded expectations in 2013-2015; based on these high levels of uptake, many PAs submitted Mid-Term Modifications to continue this popular offering. For 2016-2018, the PAs have been able to forecast with greater precision given five years of historical data, providing a better sense of demand for HEAT Loan.

The PAs also rely on evaluation results to help them in planning. The Home Energy Services Initiative and HEAT Loan Delivery Assessment, completed in July 2015, demonstrated the popularity and effectiveness of the HEAT Loan financing option. This evaluation noted that 83 percent of respondents that received a HEAT Loan were "Very Satisfied" with it. For those customers that financed a measure with the HEAT Loan, the HEAT Loan was identified as the most influential factor in the decision making process. These types of evaluation results show that HEAT Loan is effective at helping PAs to address customer financing barriers and achieve energy savings.

Home Energy Services and C&I Direct Install Close Rates

Customer participation in the Home Energy Services core initiative has been very robust, and is expected to continue to be a successful offering in 2016-2018. The percent of customers installing insulation and air-sealing has also continued to increase each year. This is due to a multitude of strategies undertaken by the PAs to address participation barriers and achieve deeper participant savings.

While the PAs have long offered generous incentives, interest-free financing, and targeted customer follow up to achieve deeper participant savings, over the past three years the PAs undertook additional efforts to understand and address more niche markets. Those strategies include increasing consumer education through ongoing marketing, introducing an online energy assessment that provides customers property specific recommendations, and strategic follow up to customers with identified opportunities. Additionally, the PAs will continue to offer the pre-weatherization barrier incentives in 2016-2018. Based on the lessons learned from Efficient Neighborhoods+®, the PAs have developed a new enhanced offering for moderate income customers in 2016-2018 to address participation barriers and achieve deeper savings.

In addition to the strategies mentioned above, the PAs have also taken into account customer response to volatile electric rates in the winter and the effect of severe weather in recent years. These circumstances have contributed to increasing demand for residential energy efficiency services, which the PAs have, and will continue to, respond to in order to achieve greater participant savings.

Regarding the C&I Direct Install core initiative, the PAs have substantial experience in serving this customer group, as they have been offering the C&I Direct Install core initiative in various forms for over two decades. The PAs do not look at project measures installed versus measures proposed for planning purposes. Instead, to increase participation and per-customer savings, the PAs seek segment-specific opportunities, review city or town small business participation rates, and study technological penetration rates when planning new initiatives targeted at small businesses.

HES Oil Heating Participants

The electric PAs offer fuel-blind energy efficiency services to customers in homes with 1-4 units through the HES core initiative, including customers who heat with oil. The PAs do not use the data requested in this question regarding percentage of HES oil heating participants receiving either weatherization or heating system upgrades to address participation barriers or achieve deeper savings. Increasing participation among all customers, including those who heat with oil, is a focus of PA efforts through its fuel blind programs.

One example of PA programs that reach oil heating customers is the early heating system replacement initiative, which has been a highly successful offering for customers who heat with oil. This initiative has historically been promoted as a limited time offer and encourages customers with functioning oil boilers 30 years or older and oil furnaces 12 years or older to replace that equipment with energy efficient alternatives. Customers are offered enhanced incentives for replacing these systems prior to failure. This initiative has attracted over 4,000 oil heat participants to date, despite it being a limited time offer.

Standard oil heating and hot water system rebates and rebate forms are on the Mass Save website; customers may apply for their rebates online without a home energy assessment. The success of current fuel blind programs among participants in HES has helped the PAs to estimate fuel-blind planning values for participants in the multi-family core initiative in the 2016-2018 Plan term.

a. The following tables give the un-weighted participation rates for each PA in 2013 and 2014 by Industry Sector (Table 3-1 and Table 3-2) and by customer size range (Table 3-3 and Table 3-4). Data is provided separately for 2013 and 2014. The C&I Customer Profile Study for 2014 is currently underway, and past year information is refreshed with each updated study, so both the 2013 and 2014 data is preliminary. The majority of upstream lighting data is not included in the provided data, since these customers could not necessarily be linked to individual billing accounts. Further, not all non-upstream participant accounts could be matched with billing account information. For the gas programs, the statewide merge success rate of tracking to billing account information is 85% for 2014. For the electric programs, the statewide merge success rate for 2014 is 36% when the upstream data is included, and 87% when upstream data is not included. Since a large segment of participation data cannot be linked to billing data, the participation rates given in this response should be cautiously interpreted.

   Along with the recognizable Industry sector descriptions included in the following tables, there are three categories used to group data that could not be categorized:

   - No Data – Indicates that a record was blank and nothing is known about that account. This is most often the case when a participant account could not be matched to billing data, as with upstream.

- Unknown – Indicates the PA provided a code for the industry sector, but the provided code was mis-keyed, such as 99999.
- NA – Almost always a result of information provided by tax data for accounts with a residential code. In such cases, the tax code is kept, but the account is not a good fit for any other industrial sector category. An example could be an office run out of a residential home address.

Results by size range are shown by kW for electric programs, and therms for gas programs.

Table 3-1

Electric Yearly Participation Rate – Unweighted*		**Year**	
PA	**Industry Sector**	**2013**	**2014**

b. Please see the tables below for each PA for parts (b) and (c) of this Question 3. The Program Administrators made the following assumptions in order to best respond to these questions:

- Since 2013 is the first year of the term, all participants for the 2013 program year are considered to be new.
- Participation is isolated to core initiatives, since PAs count participants separately in each core initiative. For example, if a residential customer participated in Home Energy Services in 2013 and Heating & Cooling in 2014, that customer would be counted as "new" in each initiative.
- PAs used unique account numbers as a proxy for participants for the purpose of this question because unique accounts are the only way to determine if a participant is new or repeat. Therefore, core initiatives that cannot be tracked back to unique account numbers could not be included here. These core initiatives that could not be tracked include: Residential Lighting, Residential Behavior/Feedback, a portion of Residential Consumer Products, the portion of C&I New Construction associated with C&I Upstream Lighting, some true new construction accounts, other various upstream measures and other miscellaneous accounts which may have started or ended service.

Please see Table 3-5 on the following pages, which includes information responding to parts b and c of this Question 3.

Table 3-5: CLC

* All or portions of these programs have upstream components. These totals exclude any savings or participants associated with upstream participation as they cannot be tied to account numbers.

* The Company has historically reported participants for the Residential and Multi-Family core initiatives as the sum of units in a participating facility and cannot parse out the individual accounts associated with new and repeat savings

c. Please see the response to part (b) above.

d. For the residential sector, in 2013, 4.2 percent of customers participated in multiple core initiatives; a total of 58,906 residential premises (inclusive of both fuels) participated in two or more initiatives out of a total of 1,410,742 premises that participated in any initiative. This data is provided from the Residential Customer Profile Study, completed in October of 2015. Because it was the first year that this type of study was completed in the residential sector and took longer than expected to complete, this data is only available for 2013. As a result, the data above is most likely understating the number and percentage of customers participating in multiple core initiatives over the three-year period and would be more meaningful if we had additional years of data available.

Note that this data does not include low-income participants. Because there are only two core initiatives in the Low-Income sector and they are based on housing type (single family or multi-family), the question of multi-initiative participation does not apply.

Data for the C&I Sector is also provided by the C&I Customer Profile Studies. The C&I Customer Profile Study for 2014 is currently underway, so the data provided is preliminary. The PAs do not currently have a reliable method to tie electric and gas accounts for a single premise, so the data shown in Table 3-6 below provides separate gas and electric information. The “Total Accounts” represents the total number of accounts in the population, whether they participated in the programs or not, including customers who participated in upstream programs. Note that this definition differs from that used in the residential sector, which used “Participating Customers” as the denominator. The definition of multi-initiative also varies slightly here, as the data represents Multi-Year Participants, or those participants who participated in both 2013 and 2014, regardless of core initiative. Because upstream participant data usually cannot be tied to a specific account, it is often not possible to determine if an upstream customer has participated in multiple years. Because the total accounts do include upstream customers, but the multi-year participants do not include all upstream customers, the resulting percentages are underestimated.

The C&I core initiatives are highly correlated with the type of equipment being replaced. For example, new or end of useful life equipment goes through the new construction program, while most existing equipment would go through retrofit. Therefore, since a customer could have both existing and end of useful life equipment at the same facility, it is possible to participate in multiple core initiatives.

Table 3-6: Multi-Year Participation

Fuel	Total Accounts	Multi-year Participants	Percentage
Statewide Electric	39,293	1,009	2.6%
Statewide Gas	7,901	280	3.5%

e. HEAT Loan eligibility is determined by the energy efficiency measures or services a customer installs or receives; therefore, the PAs used HEAT loan eligible measures as a proxy for determining participation rates for the HEAT Loan. For the purpose of this question, eligible measures were defined as: heating equipment, water heating equipment, central AC/air source heat pumps, and insulation. Statewide, 26% of HEAT Loan eligible measures were financed using the HEAT Loan. This number was calculated by dividing the total number of measures that were financed by a HEAT Loan by the total number of measures eligible for a HEAT Loan. This number, however, may not accurately represent the impact of the HEAT Loan for several reasons, including:

- Only measures with a co-pay of over $500 are eligible for a HEAT Loan. As an example, some insulation jobs may have required a co-pay of under $500 after all applicable incentives were applied. In this case, although insulation is technically a HEAT Loan eligible measure, this specific job would not be eligible for a HEAT Loan.
- Some measures may be eligible for HEAT Loan financing as part of a package but not necessarily as an individual measure. An example of this is a Wi-Fi enabled thermostat. A participant that installs a new heating system and receives insulation may also install a Wi-Fi thermostat and finance the whole package with a HEAT Loan. However, a customer may not finance a Wi-Fi thermostat by itself with the HEAT Loan. For this reason, smaller measures like Wi-Fi thermostats are not included in the denominator (number of HEAT Loan eligible measures) of this calculation.

f. In the residential table below, the Program Administrators have defined the HES close rate as customers who participated in a Home Energy Assessment (“HEA”) and received turn-key weatherization retrofit work. The table provides Program Administrator HEA to weatherization retrofit close rates, as well as the approximate average weatherization recommendation rate from January 2013 through August 2015. PAs note that not all customers receiving an HEA are good retrofit candidates and thus do not receive a recommendation. Calculating the close rate using recommendation to completed retrofit provides additional insight. Open market, downstream equipment rebates are not included in the retrofit calculation.

For the C&I Direct Install initiative, savings shown in the table below are based on gross savings recorded for projects proposed or completed in the given year. As such, installed figures may not exactly match PA-reported savings due to timing and claiming of savings protocols, in addition to any differences between net and gross savings. All dollar amounts are Customer Incentive dollars.

Table 3-7

Statewide HES Close Rates:

	Close Rate 2013	Close Rate 2014	Close Rate 2015 (YTD August 2015)	Average Rate of Retrofit Recommendation (2013 - YTD August 2015)*	Avg. Adjusted Close Rate (recommended to completed)
CLC	63%	64%	39%	87%	64%
EVERSOURCE (NSTAR Elec)	37%	37%	37%	82%	45%
EVERSOURCE (WMECo)	24%	30%	41%	86%	36%
NGRID Electric	31%	37%	37%	83%	42%
Unitil Electric**	55%	61%	33%		
Berkshire	27%	30%	38%	50%	61%
Columbia	29%	35%	43%	77%	46%
EVERSOURCE (NSTAR Gas)	31%	29%	31%	71%	43%
Liberty	18%	24%	18%	60%	33%
NGRID Gas	25%	31%	32%	71%	42%
Unitil Gas**	65%	75%	25%		

* Retrofit defined as turn-key, weatherization retrofit. Recommendation rates include HEAs that identified pre-weatherization barriers that require mitigation prior to weatherization implementation. Eversource (WMECo) recommendation rate calculation comprised of Jan-August 2015, additional historical recommendation rates unavailable due to lead vendor transition.

**Unitil did not require its Home Performance Contractors (“HPCs”) to collect or report data regarding the estimated retrofit recommendations until late 2014 when it adopted the lead vendor model. Therefore, Unitil is not able to accurately calculate or report the rate at which recommended measures were adopted by customers for the time period in question.

Please see Table 3-8, the C&I Direct Install tables, on the following pages.

Note: Installed savings and incentive $ shown here are based on gross savings and dollars recorded by SB vendor(s) for installations completed in the given year. As such, installed figures may not exactly match PA-reported savings and $, because of differences in timing between the PA's accounting systems and the vendors', in addition to any differences between net and gross savings.
The PA's vendors do not record line numbers 2 and 3 above, therefore, line number 4 cannot be calculated.

g. For percentage of HES oil heating participants receiving either weatherization of heating system upgrades, please see Table 3-9 below.

Table 3-9

Electric PAs – HES Oil Heating Participants			
	Number of oil customers with HEAs, 2013-2015	Number of oil HES participants that have received weatherization and/or heating system upgrades, 2013-2015	Percentage of HES oil heating participants receiving either weatherization or heating system upgrades
Cape Light Compact	4941	3318	67%
Eversource - NSTAR	25212	15125	60%
Eversource - WMECO	8136	3200	39%
National Grid	53952	23918	44%
Unitil	1047	545	52%

Please note that some oil customers have opted to initiate a conversion (outside of energy efficiency) to other fuels as the primary heating source (*e.g.*, heat pumps, natural gas). Heating equipment numbers are comprised of those who took advantage of oil heating rebates.

Unitil notes that it does not have data on the heating type of some customers who received a home energy assessment in 2013 and 2014. These customers comprise about 13% of Unitil's total number of HEAs from 2013-2015.

4. Provide pre-filed testimony describing how the Program Administrators intend to engage outside organizations (e.g., trade allies and community organizations) to enhance program delivery during the 2016-2018 term. Provide examples of outside organizations that may be so engaged.

Response:

Please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition). See also Section III.K of the Plan for similar information on community engagement and Appendix L for additional information on individual PA efforts.

5. Provide pre-filed testimony describing how the Program Administrators intend to overcome barriers to serve hard-to-reach/underserved communities during the 2016-2018 term.

Response:

Please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition).

6. Identify and describe new technologies and initiatives that the Program Administrators have included in their respective 2016-2018 plans. Explain how the Program Administrators evaluate new technologies and initiatives to determine cost-effectiveness and savings potential.

Response:

The Program Administrators have been national leaders in their commitment to innovation, and the development and deployment of cutting-edge new technologies. The PAs are committed to studying and implementing new technologies and initiatives in 2016-2018. Please see Section III of the Plan for a full description of the PAs' program designs, which include discussions regarding the PAs' ongoing commitment to innovation and technology in their programs in 2016-2018.

Among the newer technologies under review for 2016-2018 program inclusion are the following:

- Air source and water source gas engine driven heat pumps;
- Several proprietary gas fired heat pumps with variable refrigerant flows;
- Removable jackets for valves, fittings and specialty piping in boiler rooms and other mechanical spaces;
- Advanced rooftop unit controllers that may have application in big box stores;
- A pipe, valve and tank insulation tool that can be used to calculate savings for insulating steam or hot water piping, valves and tanks for customers with usage of less than 50,000 therms per year;
- Distributed refrigeration that can reduce the pounds of refrigerant used and increase usable floor space in supermarket applications;
- Electrically commutated motors for pumping applications;
- Drain water heat recovery;
- Heat pump dryers;
- Automatic temperature control which provides thermostat optimization, load shifting and demand response control as well as communication and bill estimation capabilities;
- Thermal storage optimization control strategies to shift hot water load;
- A boiler QI tool which optimizes the heating system performance and boiler sizing;
- Smart communicating appliances which allow communication and utility control of appliances;
- Advanced buildings net energy optimizer (NEO) building energy modeling;
- Analytics to assess post construction zero energy building performance;
- Existing building HVAC retrofit controls;

- Emerging HVAC technologies;
- Automated window shades;
- Exterior performance lighting;
- Existing space performance lighting;
- LED integrated control logic;
- Smart grid controlled street lighting;
- A variety of emerging lighting technologies
- Window glazing;
- Highly efficiency filtered fume hoods;
- Smart plugs;
- Ozone laundry;
- Air operated double diaphragm (AODD) pump control;
- Washing with polymer beads;
- Hand dryers;
- Building insulation;
- Energy recovery filters

Some of the new initiatives described in the Plan include:

- Renter specific visit
- Moderate income program enhancement
- Project point of contact multi-family program optimization
- Customer experience streamlining deep review
- Home-automation technologies exploration
- Promoting value of net-zero and renewable-ready measures
- "Path to Zero" option
- Sustainable Office Design
- Retrocommissioning
- Expanding education and training for customers, trade allies, contractors
- Initiatives to engage the real estate development community

The Program Administrators solicit and accept new technologies as potential candidates for inclusion in their programs from a variety of sources, including through the Massachusetts

Technical Advisory Committee ("MTAC"). MTAC reviews new technologies that have the potential to cost-effectively save energy. MTAC is both a proactive and a reactive body, and consists of key technical staff from among the PAs. The committee addresses both residential and commercial/industrial technologies, drawing on the subject matter experts from the committee, PA staff, or outside expertise as necessary. It establishes and publishes threshold technical requirements that must be met to qualify products or processes as eligible for program incentives. It documents its findings in a standardized manner and disseminates them to the PA program managers, technical staff, account managers, and outside parties such as vendors, customers, and other interested parties, as appropriate. The PAs welcome vendors and manufacturers to submit products directly for review. A portal on the Mass Save website provides criteria and instructions for direct submittal to the MTAC. The clearly-articulated and open process by which MTAC reviews submitted technologies provides a level playing field for all. Any manufacturer or vendor of an emerging or newly-commercialized efficiency technology can make a science-based case for acceptance of their product into the PA incentive offerings.

PAs also review incremental advancements in traditional and proven energy efficiency measures, such as the integration of smart technology to known mechanical equipment. Such incremental improvements may not require a full MTAC assessment, but rather may be implemented by each PA on a case by case basis, with results shared amongst all.

Additionally, new products often emerge from the field, when proposed by customers or vendors to address a unique efficiency opportunity, or address a more common opportunity in a unique way. When a technical review shows promise, these emerging technologies are often vetted in real-world application through a custom application or in a structured field trial.

The PAs have established formal and informal working relationships with such organizations as: the Consortium for Energy Efficiency ("CEE"), the Northwest Energy Efficiency Alliance (NEEA), the California Emerging Technologies Coordinating Council ("ETCC"), the Northwest Regional Technical Forum ("RTF"), NYSERDA's Emerging Technologies Accelerated Commercialization initiative, Southern California Edison's Lighting Research Program, the Fraunhofer Center for Sustainable Energy Systems, the Food Service Technology Center, and several of the Department of Energy's National Research Laboratories. These relationships can involve a continuum of activities from simple information exchange to participation in jointly funded and managed research, technology assessments, or field tests.

PAs also examine new technologies, initiatives, and strategies in their management committees, including the RMC, C&IMC, EMC, and related working groups. New initiatives may arise in response to changes in market conditions or the appearance of new savings opportunities during the course of Plan implementation, and PAs are able to review these circumstances in management committees and respond in order to take advantage of the changes. An example may be an initiative to partner with the college and university sector to install LED lighting when the technology reaches a price point that makes retrofits at scale economical. PAs also welcome non-technology proposals from stakeholders through the structured Proposal Process, by which any third-party organization can propose a program concept or proposal to supplement or enhance the PAs approved programs to the management committees. This process and related forms is available on MassSave.com.

New technologies and initiatives are evaluated to determine cost-effectiveness and savings potential using the approved statewide custom screening tool by each PA in accordance with project specific inputs. The PAs have also established protocols through the EMC to review new product cost-effectiveness, including establishing the roles and responsibilities of implementers and evaluators, the process for screening, end-of-year review, and application of evaluation results.

7. Provide a table that summarizes evaluation, measurement, and evaluation ("EM&V") study recommendations and indicates whether the Program Administrator has implemented the recommendation, to date, for each study completed during the 2013-2015 term. If a recommendation has not been implemented, explain why not.

Response:

Please see Table 7-1 on the following pages.

Table 7-1 (EM&V Study Recommendations)

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
1	Massachusetts Residential Lighting Cross-Sector Sales Research	Residential	2015 Plan Year	App. U, Study 1	Electric	2015-1-1	The evaluation team recommends using a placeholder value of 7% to be applied to the Massachusetts upstream lighting program sales to reflect the proportion of residential program lighting used in commercial settings.	Statewide	Currently Under Consideration.							
2	Multistage Lighting Net-to-Gross Assessment: Overall Report	Residential	2015 Plan Year	App. U, Study 2	Electric	2015-2-1	The evaluators recommend using the NTG values identified in the study to estimate program impacts.	Statewide	Currently Under Consideration.							
3	Multistage Lighting Net-to-Gross Assessment: Overall Report	Residential	2015 Plan Year	App. U, Study 2	Electric	2015-2-2	The evaluation team recommends that PAs closely monitor the market, and periodically revisit and if necessary revise the 2016-2018 NTG estimates. If these NTG estimates change substantially, the evaluation team recommends that policy makers allow PAs to apply the new NTG estimates to develop revised savings targets for the 2016-2018 period.	Statewide	Currently Under Consideration.							
4	Lighting Market Assessment and Saturation Stagnation Overall Report	Residential	2015 Plan Year	App. U, Study 3	Electric	2015-3-1	The PAs should continue to provide incentives and educate consumers about LEDs in the next program cycle. At the same time, the PAs should monitor any new information that becomes available from future evaluations or other sources regarding delta Watts, measure life, price trends, and incremental costs, and be ready to shift LED strategy if providing incentives ceases to be cost effective.	Statewide	Currently Under Consideration.							
5	Lighting Market Assessment and Saturation Stagnation Overall Report	Residential	2015 Plan Year	App. U, Study 3	Electric	2015-3-2	The PAs and EEAC consultants should continue to fund regular on-site saturation studies—including the continued annual panel study—at least through the early 2020s in order to track the impact of Energy Independence and Security Act (EISA), changes in LED pricing and availability, and possible changes in effectiveness of incentives for standard and specialty CFLs and LEDs.	Statewide	Currently Under Consideration.							
6	Lighting Market Assessment and Saturation Stagnation Overall Report	Residential	2015 Plan Year	App. U, Study 3	Electric	2015-3-3	The PAs should work with the residential evaluation team to develop a methodology for identifying the diameter and length of fluorescent tubes in use in homes.	Statewide	Currently Under Consideration.							
7	Baseline Sensitivity Analysis 2016 - 2018	Residential	2015 Plan Year	App. U, Study 4	Electric/Gas	2015-4-1	No formal recommendations were made in this evaluation		N/A							
8	Lighting Interactive Effects Study Preliminary Results	Residential	2015 Plan Year	App. U, Study 5	Electric	2015-5-1	The evaluation team recommends reassessing the preliminary results by incorporating multi-family building types using recent data developed during the low income multi-family billing analysis and HVAC saturations and building types from the Residential Customer Profiling study.	Statewide	Currently Under Consideration.							
9	Program Assessment Tube TV Recycling	Residential	2015 Plan Year	App. U, Study 6	Electric	2015-6-1	The evaluation team recommends not expanding the existing recycling program to CRT-TVs.	Statewide	The PAs will adopt recommendation to not expand the existing recycling program.							
10	Program Assessment Tube TV Recycling	Residential	2015 Plan Year	App. U, Study 6	Electric	2015-6-2	Consider a follow up study to measure natural TV replacement in the Massachusetts market.	Statewide	Currently Under Consideration.							
11	Program Assessment Tube TV Recycling	Residential	2015 Plan Year	App. U, Study 6	Electric	2015-6-3	Future studies should be conducted in 4-6 years to measure whether CRT-TVs are indeed being replaced naturally.	Statewide	Currently Under Consideration.							
12	Cool Smart Incremental Cost Study	Residential	2015 Plan Year	App. U, Study 7	Electric	2015-7-1	No formal recommendations were made in this evaluation		Although this study did not make any formal recommendations, the PAs are using the study's incremental cost results to update its evaluation of the cost effectiveness of the COOL SMART program.							
13	Home Energy Services Initiative and HEAT Loan Delivery Assessment	Residential	2015 Plan Year	App. U, Study 8	Electric/Gas	2015-8-1	To encourage HPCs to further promote non-HES Mass Save offerings, consider exploring approaches for holding all HPCs accountable for cross-promoting programs and providing additional clarity to HPCs about non-HES program offerings.	Statewide	Currently Under Consideration							
14	Home Energy Services Initiative and HEAT Loan Delivery Assessment	Residential	2015 Plan Year	App. U, Study 8	Electric/Gas	2015-8-2	Conduct additional research with customers to test their receptivity to a customized web portal	Statewide	Currently Under Consideration							
15	Home Energy Services Initiative and HEAT Loan Delivery Assessment	Residential	2015 Plan Year	App. U, Study 8	Electric/Gas	2015-8-3	Explore approaches for optimizing assessment delivery to more effectively disseminate information, encourage cross-program participation, and increase close rates	Statewide	Currently Under Consideration							
16	Home Energy Services Initiative and HEAT Loan Delivery Assessment	Residential	2015 Plan Year	App. U, Study 8	Electric/Gas	2015-8-4	Streamline program materials by identifying needs for summary additional program materials and improving clarity and salience in program materials provided to customers in advance of home energy assessments	Statewide	Currently Under Consideration							
17	Home Energy Services Initiative and HEAT Loan Delivery Assessment	Residential	2015 Plan Year	App. U, Study 8	Electric/Gas	2015-8-5	Explore opportunities to further promote the HEAT Loan outside of the HES program.	Statewide	Currently Under Consideration							
18	Residential Customer Profile Study	Residential	2015 Plan Year	App. U, Study 9	Electric/Gas	2015-9-1	No formal recommendations were made in this evaluation		N/A							
19	Multifamily Impact Findings Memo	Residential	2015 Plan Year	App. U, Study 10	Electric/Gas	2015-10-1	Placeholder results from the study should not be used by the Massachusetts Program Administrators (PAs) due to concerns with data sufficiency, sample representation and broader concerns stemming from analysis performed at the premise level.	Statewide	Currently Under Consideration.							
20	Multifamily Impact Findings Memo	Residential	2015 Plan Year	App. U, Study 10	Electric/Gas	2015-10-2	A new analysis at the facility level should be performed for National Grid, where facility level activity is understood to be reliably tracked in a way that allows the aggregation of consumption and tracking data for each treated building.	Statewide	Currently Under Consideration.							
21	Ductless Mini-Split Heat Pump (DMSHP) Final Heating Season Results	Residential	2015 Plan Year	App. U, Study 11	Electric	2015-11-1	Evaluators have made no final recommendations at this time, except to adopt a lower heating FLH value.	Statewide	The PAs plan to adopt the recommendations							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
22	Ductless Mini-Split Heat Pump (DMSHP) Baseline Determination	Residential	2015 Plan Year	App. U, Study 12	Electric	2015-12-1	The evaluation team has made no formal recommendations at this time, except to present a possible baseline mix consistent with the draft scenarios presented.		N/A							
23	Massachusetts Low-Income Multifamily Initiative Impact Evaluation	Residential	2015 Plan Year	App. U, Study 13	Electric/Gas	2015-13-1	No formal recommendations were made in this evaluation.		N/A							
24	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-1	The Massachusetts PAs should employ multiple channels to promote BOC and the subsidies.	Statewide	Currently Under Consideration.							
25	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-2	The PAs should craft BOC messaging that conveys the value proposition of certification and maintenance of certification to high-level managers.	Statewide	Currently Under Consideration.							
26	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-3	The PAs should encourage high-level managers who take the training to also send their operators with day-to-day O&M responsibilities.	Statewide	Currently Under Consideration.							
27	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-4	The PAs should promote BOC to participants of other energy efficiency programs.	Statewide	Currently Under Consideration.							
28	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-5	The PAs should claim savings for each subsidized customer for eight years from the initial year of certification – that is, for the year of certification plus seven additional years.	Statewide	Currently Under Consideration.							
29	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-6	The PAs should *not* claim additional savings for an individual's Level 2 certification beyond those claimed for Level 1 certification.	Statewide	Currently Under Consideration.							
30	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-7	The PAs should claim two-thirds of the recommended per-operator savings for a second subsidized operator at a given workplace.	Statewide	Currently Under Consideration.							
31	Comprehensive Review of Non-Residential Training and Education Programs, with a Focus on Building Operator Certification	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 14	Electric/Gas	2015-14-8	The PAs should consider designing and implementing additional adult efficiency education/ training programs.	Statewide	Currently Under Consideration.							
32	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-1	Test alternative residential behavior-based program offerings. Programs relying on web portals and smartphone applications can provide lower cost opportunities with comparable savings to the HER program.	Statewide	Currently Under Consideration.							
33	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-2	Consider conducting an opportunity assessment of existing program offerings to identify opportunities for employing behavioral strategies, such as commitments and framing, to further enhance program participation.	Statewide	Currently Under Consideration.							
34	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-3	Further explore opportunities for addressing barriers faced by PAs serving small markets in delivering behavior-based programs, particularly around partnership, evaluation methods and requirements for claiming savings, and assumptions regarding measure life.	Statewide	Currently Under Consideration.							
35	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-4	Consider testing a workplace engagement program to initiate experience with small and medium commercial behavior programs.	Statewide	Currently Under Consideration.							
36	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-5	Consider implementing kit-based education programs. Involve appropriate stakeholders in design and implementation to ensure behavioral savings can be quantified and claimed.	Statewide	Currently Under Consideration.							
37	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-6	Monitor the outcome of K-12 programs promoting school-wide energy-saving through culture change in similar jurisdictions with periodic, targeted reviews of key programs cited in this research.	Statewide	Currently Under Consideration.							
38	Comprehensive Review of Behavior and Education Programs	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 15	Electric/Gas	2015-15-7	Consider the possibility of path-breaking, targeted research around behavior-based programs in higher education.	Statewide	Currently Under Consideration.							
39	Massachusetts Behavioral Programs Process Evaluation	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 16	Electric/Gas	2015-16-1	The PAs and EEAC should consider mechanisms to balance the "costs" of cross-program effects to avoid undue burden on the HER program where cross-program savings are substantial.	Statewide	Currently Under Consideration.							
40	Massachusetts Behavioral Programs Process Evaluation	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 16	Electric/Gas	2015-16-2	PAs should continue with the current treatment for these customers without concern of negative customer satisfaction side effects.	Statewide	Currently Under Consideration.							
41	Massachusetts Behavioral Programs Process Evaluation	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 16	Electric/Gas	2015-16-3	The PAs should consider conducting more comprehensive exploratory research, such as in-home ethnography, to identify the potential for home automation solutions to target plug load.	Statewide	Currently Under Consideration.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
42	2014-2015 Commercial and Industrial Natural Gas Programs Free-ridership and Spillover Study	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 17	Gas	2015-17-1	Results from this study are used by the PAs in setting prospective NTGRs in their three-year plans. When results are based on more than 10 survey records, the PAs should use PA-specific results. When sample sizes are not sufficient (10 completed surveys or less), PAs should use statewide figures. The report contains the recommended NTGR values for filing purposes.	Statewide	The PAs plan to adopt the recommendations.							
43	Efficient Neighborhoods + Incremental Cost Assessment	Special & Cross Sector Studies	2015 Plan Year	App. U, Study 18	Electric/Gas	2015-18-1	No formal recommendations were made in this evaluation.		N/A							
44	Prescriptive Gas Impact Evaluation - Steam Trap Evaluation Phase 1	Commercial & Industrial	2015 Plan Year	App. U, Study 19	Gas	2015-19-1	Continue providing two steam trap programs, prescriptive and custom, to accommodate the wide variation in steam pressures and sizes, types, and number of steam traps; facility size; processes by which steam traps are repaired; and applicable savings methods and values.	Statewide	Currently Under Consideration.							
45	Prescriptive Gas Impact Evaluation - Steam Trap Evaluation Phase 1	Commercial & Industrial	2015 Plan Year	App. U, Study 19	Gas	2015-19-2	Increase measure lifetime from three to six years based on the evaluation team's literature review and analysis of MA gas customer survey data.	Statewide	The PAs are adopting the study's recommended measure life of six years.							
46	Prescriptive Gas Impact Evaluation - Steam Trap Evaluation Phase 1	Commercial & Industrial	2015 Plan Year	App. U, Study 19	Gas	2015-19-3	Convene a steam trap stakeholder group—composed of PA staff members directly involved with steam traps, program implementation subcontractors, and steam trap repair/replacement vendors—to identify common assumptions/inputs to use in the savings algorithm, with the goal of improving program accuracy and consistency at the state-wide level.	Statewide	Currently Under Consideration.							
47	Prescriptive Gas Impact Evaluation - Steam Trap Evaluation Phase 1	Commercial & Industrial	2015 Plan Year	App. U, Study 19	Gas	2015-19-4	Develop a new prescriptive steam trap deemed savings value using the savings algorithm developed in Phase 2.	Statewide	Currently Under Consideration.							
48	Prescriptive Gas Impact Evaluation - Steam Trap Evaluation Phase 1	Commercial & Industrial	2015 Plan Year	App. U, Study 19	Gas	2015-19-5	Leverage the steam trap stakeholder group to identify approaches to increase program participation and savings.	Statewide	Currently Under Consideration.							
49	Prescriptive Programmable Thermostats	Commercial & Industrial	2015 Plan Year	App. U, Study 20	Gas	2015-20-1	Perform analysis on the 2014 program data.	Statewide	Currently Underway. The PAs have adopted the deemed savings value of 32 therms per year per programmable thermostats for the time being, until the analysis of the 2014 program (and if initiated, 2014 billing) data is complete.							
50	Prescriptive Programmable Thermostats	Commercial & Industrial	2015 Plan Year	App. U, Study 20	Gas	2015-20-2	Undertake a second participant survey that is focused on the 2014 program participants to identify and examine important consistencies, variances, and changes between the 2013 and 2014 program years, as well as to clarify the use of PTs, the pre-installed condition, and the savings.	Statewide	Currently Under Consideration.							
51	Prescriptive Programmable Thermostats	Commercial & Industrial	2015 Plan Year	App. U, Study 20	Gas	2015-20-3	Conduct a billing analysis using data from both the 2013 and 2014 program years to increase the precision of the savings estimates results from a future billing analysis.	Statewide	Currently Under Consideration.							
52	Prescriptive Programmable Thermostats	Commercial & Industrial	2015 Plan Year	App. U, Study 20	Gas	2015-20-4	Consider modifications to the billing analysis that would better account for exogenous change in the participant population such as including a matched sample of small businesses, collecting some additional business-level information in the survey (e.g., hours worked by or paid to employees).	Statewide	Currently Under Consideration.							
53	Prescriptive Programmable Thermostats	Commercial & Industrial	2015 Plan Year	App. U, Study 20	Gas	2015-20-5	Given the inherent difficulties of billing analyses, continue to investigate methods to better quantify the savings achieved by PT installations, such as pre/post PT installation metering.	Statewide	Currently Under Consideration.							
54	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-1	Realization rates should be utilized for the purposes of planning and reporting as follows: Eversource (91.8%), National Grid (77.9%), Columbia Gas (72.7%) and statewide (88.3%).	Statewide	The PAs have adopted the revised realization rates.							
55	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-2	A single guidance document that codifies the various protocols, principles, and practices used for applying realization rates across all programs, both gas and electric, in all sectors, should be developed as a common reference and to minimize ambiguity.	Statewide	Currently Under Consideration.							
56	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-3	Follow the recommendation of the "Massachusetts 2013 Prescriptive Gas Impact Evaluation Steam Trap Evaluation Phase I" to commence with a Phase II activity to standardize algorithms.	Statewide	Currently Under Consideration.							
57	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-4	Further explore the role of the DRB method in impact evaluation planning, as future impact evaluations may benefit from a structured data collection of the M&V sample for ongoing measurement of program characteristics.	Statewide	Currently Under Consideration.							
58	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-5	Comprehensive Design Analysis (CDA) natural gas tracking savings included the interactive gas penalty from electric measures. The electric measure penalties should be reported as a resource penalty to the electric program and not reported as a gas program penalty.	Statewide	Currently Under Consideration.							
59	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-6	The application reviewers should cross-check the fraction of the natural gas bills a project is expected to save against typical savings fractions, particularly those that are high.	Statewide	Currently Under Consideration.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
60	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-7	Confirm existing condition ventilation rates and the efficient operation of the installed equipment, given the erratic and often poor savings rates of ventilation control measures (including ventilation heat recovery, demand controlled ventilation [DCV], and ventilation related EMS measures).	Statewide	Currently Under Consideration.							
61	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-8	The PAs should be diligent in gathering the technical assistance studies, spreadsheets, and models used to develop the project and include them in the electronic documentation, given that the application files are not always complete and sometimes miss significant information. Particular attention should be paid to the documentation of baseline conditions.	Statewide	Currently Under Consideration.							
62	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-9	Consider evaluating projects consisting of only deemed measures with deemed savings as part of technology specific evaluations.	Statewide	Currently Under Consideration.							
63	Impact Evaluation of PY2013 Custom Gas Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 21	Gas	2015-21-10	An error ratio of 0.60 is recommended for future evaluations.	Statewide	Currently Under Consideration.							
64	Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study	Commercial & Industrial	2015 Plan Year	App. U, Study 22	Electric/Gas	2015-22-1	Adopt modified code baselines that reflect standard practices as the basis for determining energy efficiency incentives.	Statewide	Currently Under Consideration.							
65	Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study	Commercial & Industrial	2015 Plan Year	App. U, Study 22	Electric/Gas	2015-22-2	Promote a focus on installation quality to realize greater savings from energy efficiency.	Statewide	Currently Under Consideration.							
66	Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study	Commercial & Industrial	2015 Plan Year	App. U, Study 22	Electric/Gas	2015-22-3	Promote high-performance building strategies to achieve additional energy savings.	Statewide	Currently Under Consideration.							
67	Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study	Commercial & Industrial	2015 Plan Year	App. U, Study 22	Electric/Gas	2015-22-4	Target code training at specific provisions to achieve additional savings from improved compliance.	Statewide	Currently Under Consideration.							
68	Massachusetts Commercial New Construction Energy Code Compliance Follow-Up Study	Commercial & Industrial	2015 Plan Year	App. U, Study 22	Electric/Gas	2015-22-5	Streamline future code compliance studies to enable more frequent, cost-effective compliance assessments.	Statewide	Currently Under Consideration.							
69	Massachusetts LED Spillover Analysis	Commercial & Industrial	2015 Plan Year	App. U, Study 23	Electric	2015-23-1	The PAs should take steps to ensure that smaller customers are exposed to opportunities to purchase incented LED lamps through Direct Install programs and strong promotions via large home improvement stores and electronics retailers.	Statewide	Currently Under Consideration.							
70	Massachusetts LED Spillover Analysis	Commercial & Industrial	2015 Plan Year	App. U, Study 23	Electric	2015-23-2	Focus program efforts on the promotion of LED linear fixtures, which account for a very high portion (roughly 80 percent) of total commercial lighting energy consumption currently.	Statewide	Currently Under Consideration.							
71	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-1	This evaluation recommends that Eversource-NSTAR utilize its own PA specific retrospective realization rates, and that all remaining PAs use the non-Eversource-NSTAR combined retrospective realization rates.	Statewide	The PAs have adopted the revised retrospective and prospective realization rates and savings factors produced in this study.							
72	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-2	Consider more research around the key finding that many chillers operate at very low part loads (i.e., not cycling, and therefore operating below the manufacturer-recommended part load values), particularly the implications for reliability, efficiency, and energy savings.	Statewide	Currently Under Consideration.							
73	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-3	Consider a closer review of chiller project applications, taking into account how chillers are currently rebated, whether they are used for comfort or data center cooling, and whether the custom track may be more appropriate for multiple chiller installations.	Statewide	Currently Under Consideration.							
74	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-4	Encourage vendors to look for additional chiller savings opportunities such as changing control set points (e.g., lower condenser water temperature, higher chilled water temperature or chilled water temperature reset).	Statewide	Currently Under Consideration.							
75	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-5	Update the air compressor baseline from the current modulating with blowdown to load/unload, even though the savings calculated from these two different baselines did not vary significantly.	Statewide	Currently Under Consideration.							
76	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-6	The retrospective realization rates for air compressors produced in this study are intended to be used by all PAs for their 2015 projects. The new prospective savings factors for air compressors and refrigerated dryers produced by this study, which are calculated based on the average operating kW of the sample of air compressors and dryers, may be used to update the values in the TRM.	Statewide	The PAs have adopted the revised retrospective and prospective realization rates and savings factors produced in this study.							
77	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-7	Recommend that compressed air vendors conduct simple short term metering to better understand their operation during off-shift periods and help improve the accuracy of the annual hours of operation.	Statewide	Currently Under Consideration.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
78	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-8	Consider a review of interval load data prior to finalizing applications, given that in many cases the actual operating hours were observed to be significantly higher, resulting in unclaimed savings.	Statewide	Currently Under Consideration.							
79	Impact Evaluation of Prescriptive Chiller and Compressed Air Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 24	Electric	2015-24-9	Encourage vendors to look for additional compressed air savings opportunities such as lowering the discharge pressure, and inspecting for and reducing air leaks.	Statewide	Currently Under Consideration.							
80	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-1	Improve Baseline or Pre-Retrofit Documentation	Statewide	Currently Under Consideration.							
81	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-2	Provide Sufficient Documentation	Statewide	Currently Under Consideration.							
82	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-3	Clearly Document Calculations of Peak Demand Savings	Statewide	Currently Under Consideration.							
83	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-4	Encourage More Comprehensive Commissioning and Updating of Tracking Estimates with Findings from Commissioning	Statewide	Currently Under Consideration.							
84	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-5	Conduct Pre-Installation Metering for More Retrofit Projects	Statewide	Currently Under Consideration.							
85	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-6	Improve use of Post Inspection to Verify Measure Operation	Statewide	Currently Under Consideration.							
86	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-7	Require Trend Data Acquisition	Statewide	Currently Under Consideration.							
87	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-8	Use of Desk Review Methodology	Statewide	Currently Under Consideration.							
88	Impact Evaluation of 2012 Custom HVAC Installations	Commercial & Industrial	2015 Plan Year	App. U, Study 25	Electric	2015-25-9	Consider Other Evaluation Methodologies	Statewide	Currently Under Consideration.							
89	Massachusetts Spring 2014 Survey Results: FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-1	Electric	2014-1-1	Future surveys should explore the reasons behind satisfaction with—and preferences for—LEDs versus CFLs among those who use both types of bulbs to understand why CFL satisfaction continues to decline. This analysis may also inform potential future trends in LED satisfaction, particularly if the results point to driving factors related to LED timing and rate of adoption.	Statewide	No: The next study is still in process, therefore the recommendation has not been adopted into the next study							
90	Massachusetts Spring 2014 Survey Results: FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-1	Electric	2014-1-2	To increase survey response rate, the Team recommends that future replications of this survey also send a pre-paid incentive with the advance letter alerting possible respondents to the study.	Statewide	No: The next study is still in process, therefore the recommendation has not been adopted into the next study							
91	Massachusetts Spring 2014 Survey Results: FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-1	Electric	2014-1-3	To explore more fully the reasons why web respondents differ from phone respondents, the Team recommends that the next iteration of this survey again offer a web/phone response option along with a phone-only response option. We believe that the offering of a web-based response platform may be more conducive to current social norms. . If the length of the survey allows, the evaluators should also add questions to help characterize web and phone respondents by their technology, lighting, and environmental opinions. Finally, if the programming of the survey allows, the strongest study design would show pictures of various bulb types to only a portion of the web respondents to assess the extent to which these visual cues affect response.	Statewide	No: The next study is still in process, therefore the recommendation has not been adopted into the next study							
92	Residential Lighting Shelf Survey and Pricing Analysis	Residential	2014 Plan year	App. 4D, Study 14-2	Electric	2014-2-1	No formal recommendations were made in this evaluation.		N/A							
93	Baseline Sensitivity Analysis Spreadsheet, 2014	Residential	2014 Plan year	App. 4D, Study 14-3	Electric/Gas	2014-3-1	No formal recommendations were made in this evaluation.		N/A							
94	Market Lift Assessment FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-4	Electric	2014-4-1	In negotiations with retail partners, stress the continuation of previous incentives to help alleviate their concerns about the additional risk involved with market lift design.	Statewide	No: We are not planning on using the market-lift model for lighting products.							
95	Market Lift Assessment FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-4	Electric	2014-4-2	Take into account the capabilities of manufacturers and retailers in collecting and providing the necessary data	Statewide	Yes.							
96	Market Lift Assessment FINAL Report	Residential	2014 Plan year	App. 4D, Study 14-4	Electric	2014-4-3	The Team recommends more in-store events and potential in-store field events to boost sales of CFLs.	Statewide	Yes.							
97	Results of the Massachusetts On-site Lighting Inventory 2014	Residential	2014 Plan year	App. 4D, Study 14-5	Electric	2014-5-1	Continue pursuit of panel study, adding in 2014 saturation study participants. The panel study results helped to answer questions regarding drivers of saturation changes and bulb replacement behavior that have been valuable in assessing the ever-changing residential lighting market. Repeating this study and expanding on the panel size will reveal whether the results observed this year represent a pattern of behavior or whether they were limited to a particular group at a specific time.	Statewide	No: The study currently is in stage 1 and has not yet been fully scoped, however the intention is to fully adopt the recommendation.							
98	Supplier and Retailer Perspectives on the Massachusetts Residential Lighting Market Final Report	Residential	2014 Plan year	App. 4D, Study 14-6	Electric	2014-6-1	No formal recommendations were made in this evaluation.		N/A							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
99	Saturation Comparison of Massachusetts, California, and New York: Final Report	Residential	2014 Plan year	App. 4D, Study 14-7	Electric	2014-7-1	No formal recommendations were made in this evaluation.		N/A							
100	Ductless Mini-Split Heat Pump Customer Survey Results	Residential	2014 Plan year	App. 4D, Study 14-8	Electric	2014-8-1	No formal recommendations were made in this evaluation.		N/A							
101	Mass Save Multifamily Program Process Evaluation Report	Residential	2014 Plan year	App. 4D, Study 14-9	Electric/Gas	2014-9-1	Create a Single Point of Contact. The PAs and EEAC should consider creating a single point of contact for each project to ensure a customer deals with one entity throughout the project cycle, regardless of the sector (residential and/or commercial) and fuels (gas and/or electric) present at the project site. This could be achieved by using an outside vendor or a network of vendors.	Statewide	For the 2016-2018 Plan, the Program Administrators (PAs) have proposed a Project Point of Contact ("PPC") as described in Residential Multi-Family Retrofit description of the Plan.							
102	Mass Save Multifamily Program Process Evaluation Report	Residential	2014 Plan year	App. 4D, Study 14-9	Electric/Gas	2014-9-2	Improve Program Tracking Systems. The PAs should consider the following two steps to address the data issues: • Create a unique premise ID for multifamily properties that is implemented across all PAs, fuels and programs. • Consider splitting out tracking and planning for C&I multifamily from the rest of the C&I portfolio, similar to the process currently implemented for multifamily residential activity.	PA Specific		For 2016-2018 the PAs will be tracking C&I multi-family gas and electric separately, similar to the process currently implemented for multi-family residential activity. The PAs are still assessing the practical considerations of creating unique premise IDs for multifamily properties across all PAs, fuels and programs.	Regarding a unique premise ID, this is under consideration. Regarding splitting out tracking and planning for C&I multifamily, this is planned for January 2016.	For 2016-2018 the PAs will be tracking C&I multi-family gas and electric separately, similar to the process currently implemented for multi-family residential activity. The PAs are still assessing the practical considerations of creating unique premise IDs for multifamily properties across all PAs, fuels and programs.	Currently under consideration	Currently under consideration	For 2016-2018 the PAs will be tracking C&I multi-family gas and electric separately, similar to the process currently implemented for multi-family residential activity. The PAs are still assessing the practical considerations of creating unique premise IDs for multifamily properties across all PAs, fuels and programs.	For 2016-2018 the PAs will be tracking C&I multi-family gas and electric separately, similar to the process currently implemented for multi-family residential activity. The PAs are still assessing the practical considerations of creating unique premise IDs for multifamily properties across all PAs, fuels and programs.
103	Mass Save Multifamily Program Process Evaluation Report	Residential	2014 Plan year	App. 4D, Study 14-9	Electric/Gas	2014-9-3	Ensure a Consistent Energy Assessment Process. A consistent assessment process is key to ensuring that there are no lost opportunities and that any forgone opportunities are recorded for future follow-up with the customer. Improvement of the process can be achieved through the training of auditors in completing a comprehensive job including a review of all the systems in common areas and major systems within unit areas. Program auditors should also be trained to involve technical engineers when required to offer an advanced engineering perspective for more customized measures.	Statewide	The PAs have created a common form, called the Energy Action Plan, or EAP, to record all facility energy efficiency opportunities found during an assessment, including a review of all the systems in common areas and major systems in units. The PPC will be responsible for using the EAP to guide the coordination of additional vendors as appropriate.							
104	Mass Save Multifamily Program Process Evaluation Report	Residential	2014 Plan year	App. 4D, Study 14-9	Electric/Gas	2014-9-4	Feasibility of Future Impact Evaluation. Considering all aspects of the data reviewed in this study, we believe a billing analysis is a feasible approach to determining savings among participating accounts. This approach can be expected to provide electric and gas overall and PA level results, although we note that for the smaller PAs such as Berkshire, Unitil and CLC, the impact results are not likely to be reliable due to the small populations that appear to be available for the analysis. We also note that while this approach can provide a realization rate against the savings predicted at the program and PA level, it will not provide realization rates at the measure level.	Statewide	A statewide billing analysis was conducted in mid-2015 and yielded inconclusive results due to unforeseen methodological issues. The team is working to determine if an alternative analysis method will be more successful.							
105	High Efficiency Heating Equipment Impact Evaluation	Residential	2014 Plan year	App. 4D, Study 14-10	Gas	2014-10-1	Use evaluation heating loads for HEHE-installed furnaces and boilers in calculating deemed savings. Previous deemed savings had used the same annual heating loads.	Statewide	Yes							
106	High Efficiency Heating Equipment Impact Evaluation	Residential	2014 Plan year	App. 4D, Study 14-10	Gas	2014-10-2	Adjust baseline equipment efficiency assumptions to account for standby and cycling losses using evaluation determined adjustment factors.	Statewide	Yes							
107	High Efficiency Heating Equipment Impact Evaluation	Residential	2014 Plan year	App. 4D, Study 14-10	Gas	2014-10-3	Consider and research ways to improve boiler operating efficiency through quality installation and contractor and homeowner education.	Statewide	Currently Under Consideration							
108	High Efficiency Heating Equipment Impact Evaluation	Residential	2014 Plan year	App. 4D, Study 14-10	Gas	2014-10-4	Use the revised early retirement baselines applied in this study and consider additional early retirement baseline research for units less than thirty years old if early retirement participation increases.	Statewide	Yes							
109	High Efficiency Heating Equipment Impact Evaluation	Residential	2014 Plan year	App. 4D, Study 14-10	Gas	2014-10-5	Consider conducting additional baseline research and/or requiring information on the application indicating the equipment that is being replaced by combination systems.	Statewide	No, but the PAs have adjusted the baseline for combination systems to represent the current mix of baselines that was discovered during the evaluation. These results were implemented into the 2014 planning report and will continue to be used for future reporting.							
110	Furnace Baseline	Residential	2014 Plan year	App. 4D, Study 14-11	Gas	2014-11-1	No formal recommendations were made in this evaluation.		N/A							
111	Variable Speed Drive Loadshape Project	Commercial & Industrial Program Studies	2015 Plan year	App. 4D, Study 14-12	Electric	2014-12-1	Continue to promote the installation of VSDs on existing equipment	Statewide	Yes							
112	Variable Speed Drive Loadshape Project	Commercial & Industrial Program Studies	2015 Plan year	App. 4D, Study 14-12	Electric	2014-12-2	PAs should integrate VSD control and commissioning requirements into program implementation activities. PAs should require specifications of the intended control strategy in their application forms, and post inspection should include verification of commissioned VSD control sequences.	PA Specific		National Grid's prescriptive VSD program is subject to a random sample of sites having post inspections, where control strategies and equipment are verified.	Eversource's prescriptive VSD program is subject to post inspection on a larger sample of installs after the study findings where what is suggested is verified.		N/A	N/A	Yes	Unitil's prescriptive VSD measures are subject to sites having post inspections, where control strategies and equipment are verified.

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
113	Variable Speed Drive Loadshape Project	Commercial & Industrial Program Studies	2015 Plan year	App. 4D, Study 14-12	Electric	2014-12-3	To support evaluation efforts, the PAs should add pre-retrofit data collection requirements to program application forms. At a minimum, the PAs should require customers to specify the type, working conditions, and operating schedule of their pre-retrofit baseline equipment.	Statewide	Yes							
114	Massachusetts Existing Buildings Market Characterization: Commercial and Industrial Customer Telephone Survey Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-13	Electric/Gas	2014-13-1	No formal recommendations were made in this evaluation.		N/A							
115	Retrofit Lighting Controls Measures Summary of Findings FINAL REPORT	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-14	Electric	2014-14-1	The Team recommends that the PAs focus on the following high potential technologies: advanced lighting controls, wireless controls, LED with controls, and daylight dimming.	Statewide	Yes							
116	Retrofit Lighting Controls Measures Summary of Findings FINAL REPORT	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-14	Electric	2014-14-2	The Team recommends that the PAs focus on the following high potential sectors: Offices, Small Business (<300 kW).	Statewide	Yes							
117	Retrofit Lighting Controls Measures Summary of Findings FINAL REPORT	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-14	Electric	2014-14-3	DNV GL recommends adjusting the lighting controls savings algorithm to include "% saved" rather than the currently used "delta hours" value. We recommend using the weighted average values from an LBNL study of 24% saved for occupancy sensors and 28% saved for daylight dimming.	Statewide	Yes							
118	Whole Systems Energy Efficiency Programs - Literature Review	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-15	Electric/Gas	2014-15-1	The evaluation team identified a number of next steps for further research into understanding how to capture additional energy and demand savings through whole system programs, including: • Conduct interviews/brainstorming session with MA PAs	Statewide	No. N/A. The recommendation pertains to suggestions for further research to be conducted by the evaluation consultant. It does not specifically pertain to action on the part of PAs. No further research has been planned at this time.							
119	Whole Systems Energy Efficiency Programs - Literature Review	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-15	Electric/Gas	2014-15-2	• Conduct interviews with program managers and market actors involved in successful programs in other states	Statewide	No. N/A. The recommendation pertains to suggestions for further research to be conducted by the evaluation consultant. It does not specifically pertain to action on the part of PAs. No further research has been planned at this time.							
120	Whole Systems Energy Efficiency Programs - Literature Review	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-15	Electric/Gas	2014-15-3	• Conduct interviews with the architects and engineers (A&E) community	Statewide	No. N/A. The recommendation pertains to suggestions for further research to be conducted by the evaluation consultant. It does not specifically pertain to action on the part of PAs. No further research has been planned at this time.							
121	Whole Systems Energy Efficiency Programs - Literature Review	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-15	Electric/Gas	2014-15-4	• Conduct focus groups with new construction building owners	Statewide	No. N/A. The recommendation pertains to suggestions for further research to be conducted by the evaluation consultant. It does not specifically pertain to action on the part of PAs. No further research has been planned at this time.							
122	Final Report of Massachusetts LED Market Effects: Baseline Characterization	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-16	Electric	2014-16-1	Maintain incentives for LED lamps and fixtures. PAs should continue to incentivize LEDs to reduce the first cost barrier and increase the saturation of LEDs across the Massachusetts market. Program managers should continue to monitor the decrease in LED prices to ensure incentives are at the optimal level.	Statewide	Yes							
123	Final Report of Massachusetts LED Market Effects: Baseline Characterization	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-16	Electric	2014-16-2	Continue to support the development of product standards and testing programs. Given the number of manufacturers entering the LED market each year and consumer unfamiliarity and concerns with LED quality and performance, the need for quality standards and consumer education is even more important.	Statewide	Yes							
124	Final Report of Massachusetts LED Market Effects: Baseline Characterization	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-16	Electric	2014-16-3	Promote programs that educate consumers on LED products and applications. We recommend that PAs continue to support educational efforts to assist consumers in selecting the LED product that best meets their needs.	Statewide	Yes							
125	Final Report of Massachusetts LED Market Effects: Baseline Characterization	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-16	Electric	2014-16-4	Promote lighting controls through programs as a way to increase lighting savings. Tying controls and LEDs together will increase the savings potential of each measure and the associated cost-effectiveness.	Statewide	Yes							
126	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-1	Investigate the geographic data at more detailed granularity. Additional analysis into geographic clusters may be useful in identifying similar C&I markets across the state that have not experienced the same depth of efficiency savings as well as yield insights into market saturation levels and the drivers behind these differences.	Statewide	Yes							
127	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-2	Investigate customer segmentation though utilization of multiple attribute filters. The categorical analysis presented in this report confirms many of the high level trends first identified in the 2011 customer profile, as well as identifies opportunities for deeper analysis. Further investigation into the data by applying multiple segmentation filters (e.g. building type, consumption size, and end use) may provide greater insight into untapped opportunities for energy efficiency that are currently masked by the high level analysis.	Statewide	Yes							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
128	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-3	Investigate in greater depth why load factor appears correlated with savings. For the second year in a row, low load factor accounts had the highest average percent savings. The level of granularity used to evaluate load factor is relatively coarse, and a more detailed investigation of how load factor and average savings are correlated may provide valuable insight into how PAs can target offerings to a large customer segment by population.	Statewide	Yes							
129	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-4	Investigate methods to improve PA specific match rates using PA supplied ID data. The ability to reliably and robustly link the PA tracking and billing data is a critical element of the customer profile report, and an important input into many other studies. The assumption inherent in scoping the 2011 and 2012 data is that account and other unique ID links are consistently formatted both within PA and year over year, and that minimal manipulations would be needed to link the data. However, this has proven more difficult than anticipated, and given the establishment and analysis of time series datasets, undertaking a deeper analysis of the data will be necessary to improve its value . Through the QA/QC process DNV GL believes that match rates can be further improved with PA specific explorations into how to effectively link data, and this standardization may be useful in improving the ability to link a customer between separate gas and electric service providers.	Statewide	Yes							
130	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-5	Further investigate multi-end use and multi-year participants and trends. The 2012 customer profile confirmed the presence and impact of participants that undertook multiple end use projects, and participants that participated over multiple years. Additional analysis guided by these summary level participant findings, for example evaluating drivers behind why certain segments have higher savings from multiple end use projects – may yield a greater understanding of end use trends, scale of effort, and – should national account flags become available – corporate adoption rates.	Statewide	Yes							
131	2012 C&I Customer Profile Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-17	Electric/Gas	2014-17-6	Further investigate the retail business participation between gas and electric. The 2012 customer profile indicated that businesses classified as retail had higher participation for electric PAs relative to gas PAs. Additional analysis into potential drivers of this – for example, do most retail sites focus on measures that are not applicable to gas (e.g. lighting), and what specific measures are being undertaken at retail locations that have a gas provider, will help to evaluate if there is an opportunity to increase participation at retail locations or if this business type constitutes a harder to serve sector for gas PAs.	Statewide	Yes							
132	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-1	Leverage trade ally customer relationships to increase customer engagement and communication. The PAs can continue to leverage trade allies to increase the likelihood of achieving any number of the success factors related to customer engagement and communication.	Statewide	Yes. Please reference the C&I Retrofit section within the C&I Program and Core Initiative Descriptions section of the 2016-2018 energy efficiency plan for more details.							
133	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-2	Increase emphasis of vendor training. By increasing the emphasis on the use of training vendors and other technical staff, the PAs will encourage and support more frequent installation of energy saving measures. Also, increased trade ally training, support and competency are important because of their strong direct relationships with customers.	Statewide	Yes. Please reference the C&I Retrofit section within the C&I Program and Core Initiative Descriptions section of the 2016-2018 energy efficiency plan for more details.							
134	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-3	Promote and leverage incentives. Program implementers can educate customers about all the incentives that are being provided and offered to increase the depth and breadth of their energy efficiency projects. When customers realize they are being offered additional discounting, they are more likely to feel more successful, decide to act, and install more measures and/or projects.	Statewide	Yes.							
135	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-4	Explore ways for customers to build internal expertise. This may take the form of a shared energy manager position to serve a group of multiple small- and mid-sized customers.	Statewide	Yes, though not specifically on a shared energy manager. Please reference the C&I Retrofit section within the C&I Program and Core Initiative Descriptions section of the 2016-2018 energy efficiency plan for more details on learnings, trainings, etc. geared at building customer expertise.							
136	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-5	Emphasize the Value of NEBs and "Being Green". By marketing the NEBs and other intangibles associated with specific projects or specific project types, the PAs will increase the potential for project success. Such marketing can take the form of case studies, which both PAs and customers noted as training and education tactics that lead to project success.	Statewide	Yes, though not specifically case studies. It's worth noting that in the C&I space, NEBs are often unique or project specific, which somewhat mutes the effectiveness of marketing a generic NEB to a given customer.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
137	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-6	Ensure the Accuracy of Technical Review and Assistance. By ensuring that the aspects of a project are technically sound and appropriate, the PAs will ensure that the project is set up for success at the outset. Even though a project that grossly overestimates project savings could still save a significant amount of energy, a customer may not view it as a success given its high expectations.	Statewide	Yes. Installation inspections and project commissioning are examples of how PAs are conducting additional work to ensure the accuracy of review and savings estimates. Accuracy is further enhanced by the evaluation-implementation feedback loop.							
138	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-7	Leverage the results of EM&V site reports. For PAs not doing so already, the results of individual EM&V site evaluations may be used as a mechanism for quality assurance, accuracy and project specific feedback. For example the PAs could follow up with a project receiving a particularly low (or high) realization rate to determine if there were any issues with the project that went unaddressed. It should be noted, however, that the EM&V work is driven by a random sample of projects and this type of exercise would not replace and program existing QA/QC efforts.	Statewide	Yes. EM&V site reports provide project specific feedback which can be leveraged to make larger programmatic changes if appropriate. Such information has produced valuable information on the performance of such measures as retro-commissioning and variable frequency drives, for example.							
139	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-8	Focus on Eliminating Project Delays and Intrusions. While the PAs can only exert so much control over the participation process, it is worth assessing participation at regular intervals to determine if there are any improvements that can be made. PAs could explore what causes project delays and develop tracking mechanisms and processes to monitor and continually improve services to ensure customer schedules and expectations are met and preferably exceeded.	Statewide	Yes. This is a consideration of PAs as alleviating project delays results in increased project execution which equates to higher savings and improved customer satisfaction. Factors affecting project execution and within PAs' control are examined during the year.							
140	Learning from Successful Projects Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-18	Electric/Gas	2014-18-9	Small PAs should adopt a simpler form of the MOUs used successfully by larger PAs. Having a signed memorandum of understanding (MOU) was one of the metrics used to identify customers with successful projects, and it was cited as a criterion for success during PA interviews. The PA Differences project found that the smaller PAs have very few large customers that can implement large projects, which are historically a key to achieving savings goals. To increase the critical savings stream from these large customers, we recommend that smaller PAs consider adopting a process similar to the formalized MOU that focuses on planning for energy efficiency over time.	Statewide	No. Small PAs will consider this recommendation for future efforts.							
141	How PA Differences Affect Outcomes Phase 2 Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-19	Electric/Gas	2014-19-1	Small PAs should consider how to increase technical expertise relevant to their largest customers and strike long-term efficiency deals with their largest customers, perhaps in the form of memorandums of understanding (MOUs).	PA Specific		N/A	N/A	N/A	Currently under consideration	Currently under consideration	Yes	Currently under consideration
142	How PA Differences Affect Outcomes Phase 2 Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-19	Electric/Gas	2014-19-2	Whenever possible, comparisons between PAs should be based on multiple years of data and focus on medium- or long-term trends.	Statewide	Yes							
143	How PA Differences Affect Outcomes Phase 2 Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-19	Electric/Gas	2014-19-3	Large and small PAs should attempt to get greater savings from the small and mid-sized customers.	Statewide	Yes							
144	How PA Differences Affect Outcomes Phase 2 Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-19	Electric/Gas	2014-19-4	Expand use of subcontractors to increase PA reach to smaller customers.	PA Specific		Yes	Yes. As an example, Eversource has engaged a subcontractor to identify additional gas opportunities in the small business segment.		Currently under consideration	Currently under consideration	Yes	Yes
145	How PA Differences Affect Outcomes Phase 2 Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-19	Electric/Gas	2014-19-5	Use targeted initiatives to achieve savings from specific measure types such as National Grid's spray valve initiative in 2012.	PA Specific		Yes	Yes. Please refer to the Commercial & Industrial Programs description narrative as part of the 2016-2018 energy efficiency plan for more details.		Upstream and targeted promotional activities	upstream, and considering targeted promotional activities	Yes	Yes
146	Massachusetts Commercial Real Estate Survey Analysis - Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-20	Electric/Gas	2014-20-1	Increase outreach to building managers and owners. Additional efforts to deepen and maintain relationships with building managers and owners can provide an avenue to promote energy efficiency programs in the commercial real estate market.	Statewide	Yes							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
147	Massachusetts Commercial Real Estate Survey Analysis - Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-20	Electric/Gas	2014-20-2	Leverage the role of account managers. The PAs should consider leveraging the role of their account managers. Account managers can continue to play a critical role in working with commercial real estate businesses as they can more readily communicate energy efficiency program information and assist customers in navigating through the participation process.	PA Specific		Yes	Yes.	CMA does not have "account managers", we do however leverage program managers and vendors to fill this role	No - Limited opportunities due to Liberty's territory. The PA participates in statewide offerings and marketing efforts.	No - Limited opportunities due to Berkshire's territory. The PA participates in statewide offerings and marketing efforts.	No/NA. Due to the unique CLC service territory and customer base on Cape Cod and Martha's Vineyard, there is not a traditional CRE market with large developers owning significant commercial property volumes. Nor does CLC have traditional account managers like a utility. CLC does however maintain a very active presence in our communities through ongoing outreach to local chambers, boards of selectmen, energy committees and other community venues.	Yes.
148	Massachusetts Commercial Real Estate Survey Analysis - Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-20	Electric/Gas	2014-20-3	Target marketing to commercial real estate businesses based on building vintage. The PAs should consider target marketing to commercial real estate businesses based on building vintage. The analysis showed that 65% of buildings built before 1990 have not undergone a renovation within the past five years and therefore may offer opportunities for energy savings.	PA Specific		Yes	Yes	No. CMA is reaching out to the market segment, but not by age of buildings as the study suggest. The PA does not have enough market intelligence to be able to target buildings by how old they are.	No. Limited opportunity in our service territory. PA targets these customers through statewide marketing efforts.	Currently Under Consideration	No. Due to the nature of CLC's customer base on Cape Cod and Martha's Vineyard, we do not have a traditional CRE market with large developers owning significant commercial property volumes.	No, The PA has limited opportunities in this target market and includes the small number of customers in its usual marketing efforts. The PA participates in statewide offerings or marketing efforts.
149	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-1	Contracting Process: • Find ways to build achievement of non-lighting and gas savings into the contracting process.	Statewide	Currently Under Consideration							
150	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-2	Contracting Process: • Make the contract process more consistent across PAs and eliminate duplication of effort.	Statewide	Currently Under Consideration							
151	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-3	Measure List, Checklist, and Assessment Process: • Strengthen the comprehensiveness checklist and implement a common electronic tool or app for all vendors.	Statewide	Currently Under Consideration							
152	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-4	Measure List, Checklist, and Assessment Process: • Clearly define and document the measures covered by the program.	Statewide	Currently Under Consideration							
153	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-5	Measure List, Checklist, and Assessment Process:• Require vendors to report and promptly share the specifications of major heating and water-heating systems for all assessments with the relevant gas PA.	Statewide	Currently Under Consideration							
154	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-6	Measure List, Checklist, and Assessment Process:• Consider sending in two assessors at once; one focused on lighting (similar to current practice) and one focused on gas-related measures.	Statewide	No, the PAs expect to be able to get at the same point with a single assessment in order to keep cost down. We will search for a more elegant solution.							
155	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-7	Measure List, Checklist, and Assessment Process:• Consider providing SB vendors with additional training to increase their knowledge of non-lighting and gas-saving measures.	Statewide	Yes							
156	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-8	Data Handling: • Tracking databases should be clearer and more consistent within and across PAs. Databases should include: clear indication of which (sub-)program measures were incented through (e.g.: SB/Direct Install, Large Retrofit, New Construction), clear indication of whether a measure was custom or prescriptive, the SB vendor associated with the measure or an explicit indication of none, and which customers received assessments, even if they did not install any measures.	PA Specific		Yes	Yes. Eversource tracking databases already provide this level of detail.	See plan	See plan	See plan	Yes	Yes.
157	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-9	Data Handling: • PAs should automate their electronic data entry.	PA Specific	Yes, to the extent practicable	Yes	No. This recommendation is vague.		See plan	See plan	Yes	Yes, to the extent practicable
158	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-10	Data Handling: • PAs should have the capability to obtain and log the assessment details from their SB vendors into a data tracking system. This would help PAs identify additional potential savings from SB participants, especially from those that do not install all recommended measures.	PA Specific		Currently Under Consideration	Yes	See plan	See plan	See plan	Yes	See plan
159	Small Business Program Process Evaluation Final Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-21	Electric/Gas	2014-21-11	Data Handling: • Formalize the process to reconcile cross-PA measure tracking if one is not already in place.	Statewide	Currently Under Consideration							
160	Massachusetts Boiler Market Characterization Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-22	Gas	2014-22-1	Seek voluntary non-confidential feedback from boiler manufacturers who expressed an interest.	Statewide	Currently Under Consideration							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
161	Massachusetts Boiler Market Characterization Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-22	Gas	2014-22-2	Conduct comparative research on boiler programs in the Northeast region.	Statewide	Currently Under Consideration							
162	Massachusetts Boiler Market Characterization Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-22	Gas	2014-22-3	Initiate "boiler product line mapping" by creating a simple matrix where 90 - 2,000 MBH boiler units provided by various manufacturers are identified .	Statewide	Currently Under Consideration							
163	Massachusetts Boiler Market Characterization Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-22	Gas	2014-22-4	Provide an overview of DOE's current NPRM for Commercial Boiler Standards (U.S. Department of Energy Notice of Proposed Rulemaking), which may mandate federal efficiency requirements for pre-packaged commercial boilers.	Statewide	Currently Under Consideration							
164	Massachusetts Boiler Market Characterization Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-22	Gas	2014-22-5	Conduct a "Massachusetts Boiler Roundtable" (a small-group forum discussion) with a select Massachusetts market-savvy boiler panel that can more effectively provide information on the evolving complex boiler market.	Statewide	Currently Under Consideration							
165	Impact Evaluation of Massachusetts Prescriptive Gas Pre-Rinse Spray Valve Measure	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-23	Gas	2014-23-1	Recommendations to Increase Savings: Results showed that a percentage of change-outs (approximately 20%) resulted in small energy savings because of either low spray valve use at a site or old valves already having low flow rates. However, solutions to address these "small-savers" in the program population do not seem practical at this time, as explained below: • There is no practical method for accurately identifying low use sites. Adopting a free change-out program would quickly become very complex and un-manageable if eligibility rules were changed to target certain commercial businesses. Site level monitoring proved that spray valve use and savings are site-specific even within the same facility, business, or building type. • No practical method exists to stop a current practice of easily modifying older spray valves to increase their flow rate. The existing program implementation practice of changing all valves to the high efficiency "tamper-proof" model appears to be prudent program administration.	Statewide	Yes							
166	Impact Evaluation of Massachusetts Prescriptive Gas Pre-Rinse Spray Valve Measure	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-23	Gas	2014-23-2	Recommendation for additional spray valve research to aid future program planning: The Massachusetts program implementation of the spray valve program utilizing direct installation contractors has resulted in the change-out of two to three thousand spray valves per year with substantial gas savings. However, given that the total state-wide inventory of spray valves and its future savings potential are finite, we developed the following key questions for future research: 1. Identify the Statewide PRSV inventory, how many PRSV's are there? 2. How many program change-outs have occurred from historic program data? 3. How many more can be done? 4. What PRSV gas savings exists for each PA?	Statewide	Will Consider for Future Studies							
167	Impact Evaluation of Massachusetts Prescriptive Gas Pre-Rinse Spray Valve Measure	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-23	Gas	2014-23-3	Currently there are synergies achieved by common program implementation occurring between multiple PAs. Further investigation of the state-wide inventory of spray valves and historic program data analysis will provide meaningful planning details for the remaining overall gas savings potential and will lead to the development of feasible future strategies for this measure. The assessment can also provide greater details specific to each PA.	Statewide	Will Consider for Future Studies							
168	T12 Phaseout Market Research	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-24	Electric	2014-24-1	No formal recommendations were made in this evaluation. Because this was a market characterization study it did not contain any explicit recommendations.		N/A							
169	2013 Commercial & Industrial Customer Profile Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-25	Electric/Gas	2014-25-1	Given the increasing interest in the Customer Profile study, refine and prioritize the metrics used to expedite analyses and increase the actionable insights generated. Among other benefits, this would provide the opportunity to assess the best approach to incorporating metrics developed through other studies—such as the PA Differences and Mid-Size Customer Needs Assessment studies—to ensure that those projects continue to deliver maximum value.	Statewide	Currently Under Consideration							
170	2013 Commercial & Industrial Customer Profile Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-25	Electric/Gas	2014-25-2	Examine how to best continue engaging small and mid-size gas customers that may have undertaken an electric PA installed gas measure. For example, we recommend exploring whether participants view the gas spray valves as "all they would do" or "the start of something bigger." This may help smaller PAs in particular refine their approaches to ensure that small and mid-size customers continue to represent cost effective savings opportunities—rather than higher-cost converts to bring back into the efficiency space. Engaging smaller customers will become increasingly important as larger customers exhaust their savings appetite.	Statewide	Currently Under Consideration							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
171	2013 Commercial & Industrial Customer Profile Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-25	Electric/Gas	2014-25-3	Further explore ways to engage sectors where account proportion and consumption-weighted participation are low in order to identify avenues for new offerings. We recommend further study to identify sub groupings of smaller customers within these sectors—particularly the Other Services sector—in order to inform the development of new programmatic offerings. These customers may be too small to merit the assignment of an account manager, but may benefit from a somewhat standard operating nature (e.g., a car wash, or a flashing light at the top of a cell phone tower) or a sector-specific strategy that would allow a “templatized” type offering to generate savings through bulk of measures—similar to what gas spray valves have accomplished in the Accommodation and Food Service sector.	Statewide	Currently Under Consideration							
172	2013 Commercial & Industrial Customer Profile Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-25	Electric/Gas	2014-25-4	Continue to integrate third party data by leveraging geographic data captured in the PA billing systems. There is potential to further expand and integrate the use of tax parcel data to help PAs target customer subsets. Consider continued refinement of how the Massachusetts PAs can leverage the geographic element of their data for actionable findings. One element of feedback received in response to the 2013 Customer Profile draft was: How do we make the maps more actionable? A strong first step towards developing more predictive and actionable geographic outputs would be to identify: 1) priority questions such as “where is participation lagging,” and 2) the predictor variables that the implementation teams suspect most influence the priority questions (e.g., energy use, building vintage, square footage, etc.).	Statewide	Currently Under Consideration							
173	2013 Commercial & Industrial Customer Profile Report	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-25	Electric/Gas	2014-25-5	Expand linking electric and gas accounts to effectively evaluate dual-PA served customers to get a complete accounting of their true energy intensity for each fuel.	Statewide	Currently Under Consideration							
174	Massachusetts Commercial and Industrial Upstream Lighting Program: "In Storage" Lamps Follow-Up Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-26	Electric	2014-26-1	The Team recommends that the PAs use the results of the Year 3 analysis to replace the results of the Year 1 analysis for LED and fluorescent lamps. The PAs may instead decide to use all of the individual components of the realization rates.	Statewide	Yes							
175	Massachusetts Commercial and Industrial Upstream Lighting Program: "In Storage" Lamps Follow-Up Study	Commercial & Industrial Program Studies	2014 Plan year	App. 4D, Study 14-26	Electric	2014-26-2	The PAs and EEAC may consider conducting a follow-up impact evaluation to assess the effectiveness of their ongoing efforts to improve the installation rate.	Statewide	Yes							
176	2013 Commercial and Industrial Electric Programs Free-ridership and Spillover Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-27	Electric	2014-27-1	No formal recommendations were made in this evaluation.		N/A							
177	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-1	• The analysis of NEIs associated with NC measures should focus on true new construction only.	Statewide	Yes							
178	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-2	• Self-reports by end users would not provide an effective means for estimating NEIs associated with most NC measures.	Statewide	Yes							
179	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-3	• Self-reports by engineering firms will provide valuable insights to estimating NEIs across the range of projects for which they perform engineering services.	Statewide	Yes							
180	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-4	• An engineering-based approach is warranted to estimate NEIs.	Statewide	Yes							
181	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-5	• (Optional) Various individuals may be able to serve on a Delphi panel to provide valuable information regarding NEI estimates, and to ensure their soundness.	Statewide	No, the PAs did not choose to incur the optional, added expense of a Delphi panel. Instead, the study contractor conducted a series of in-depth interviews with government officials, engineering firms and contractors, and building owners to obtain information that helped guide its engineering-based analysis and validate the results.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
182	Stage 1 Results and Stage 2 Detailed Research Plan - Commercial and Industrial New Construction Non-Energy Impacts Study	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-28	Electric/Gas	2014-28-6	• A limited survey effort may be suitable for select measures. o Natural replacement o Industrial process measures	Statewide	No. In Phase 2 of this project, the study contractor ultimately did not recommend a separate survey estimate for these two groups of measures because it found that: 1) only one of the PAs distinguishes natural replacement measures in its tracking data, and NEIs associated with some natural replacement measures had already been estimated as part of the 2012 C&I NEI Retrofit study, and 2) self-reported results are unlikely to result in improved benefits over the engineering-based approach adopted in the Stage 2 study, as the sample size is likely to be small.							
183	Top-down Modeling Methods Study - Final Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-29	Electric/Gas	2014-29-1	Continue refinement of the PA-muni model to investigate the stability of models and possible changes to model specification that may reduce confidence intervals.	Statewide	Yes							
184	Top-down Modeling Methods Study - Final Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-29	Electric/Gas	2014-29-2	Investigate the possibility of a national or multi-state model that builds on the lessons learned from the PA-muni model, but using non-program states as a comparison area.	Statewide	Will Consider for Future Studies							
185	Top-down Modeling Methods Study - Final Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-29	Electric/Gas	2014-29-3	For the PA-data model, continue to collect data through the C&I and residential databases to extend the available data series to include five years of consumption and program tracking data, then continue collecting the necessary data going forward for future analysis. Continue to refine the existing models to incorporate multiple lag periods of the program and consumption variables.	Statewide	Yes							
186	Code Compliance Results for Single-Family Non-Program Homes in Massachusetts	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-30	Electric/Gas	2014-30-1	Future statewide compliance estimates will need to account for stretch code homes. Stretch code homes were just beginning to be built at the time of the 2009 IECC inspections and thus represented a very small portion of the overall population. As a result, they were excluded from this analysis.	Statewide	Yes							
187	Massachusetts Cross Cutting Evaluation Home Energy Report Decay Analysis	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-31	Electric/Gas	2014-31-1	Given the limitations of this study (e.g., the electric and gas cohorts experienced differing incremental levels of treatment reduction), the Team recommends that the PAs undertake further research to help inform the design of treatment reduction strategies. We recommend that future experiments plan the timing of treatment reductions to further test the potential impact of the following factors: • Treatment duration prior to the experiment: Within the same fuel, or even within a larger cohort, how does decay change when the first reduction occurs after one, two, or three years? • Seasonality of reduction: How does a treatment gap in the winter compare with one in the summer? Is there a way to optimize winter gaps to achieve greater persistence? • Duration of the reduction: How does persistence vary with the length of the treatment reduction period? • Fuel-specific differences: Test similar reductions with participants at the same "program maturity" level between electric and gas.	Statewide	Will Consider for Future Studies							
188	Efficient Neighborhoods + Initiative Evaluation Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-32	Electric/Gas	2014-32-1	The survey results showed that participants were more likely to learn of the initiative through door-to-door outreach, phone calls, and family and friends than from non-participants. Since learning about the initiative from a trusted source also appears to be effective, the PAs could encourage participants to tell their neighbors about the initiative or provide additional incentives for referrals. Participants were also more likely than non-participants to have learned about the initiative through multiple sources. The PAs should consider conducting a high volume marketing campaign that uses multiple tactics.	Statewide	Yes							
189	Efficient Neighborhoods + Initiative Evaluation Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-32	Electric/Gas	2014-32-2	The PAs should consider using messaging that ties the assessment and improvements to current customer needs. One such way is aligning initiative messaging with seasonal needs (e.g., messaging about increased comfort due to energy efficiency during the winter months), which some PAs already do.	Statewide	Yes							
190	Efficient Neighborhoods + Initiative Evaluation Report	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-32	Electric/Gas	2014-32-3	A barrier apparent from the survey results is the belief among many assessment participants that the recommended improvements were unnecessary. Additional research could suggest alternative information or messaging that might help convince customers that the recommendations are worth doing.	Statewide	Yes							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
191	Massachusetts Cross-Cutting Behavioral Program Evaluation Opower Results	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-33	Electric/Gas	2014-33-1	The evaluation team recommends that the PAs adopt the following savings estimate ratios in future years when third-party impact evaluations are not completed. o National Grid Electric: 95% o National Grid Gas: 98% o NSTAR Electric: 104% o NSTAR Gas: 98% o WMECo Electric: 104%	PA Specific	Yes	National Grid has adopted the recommended realization rates.	Yes		N/A	N/A	N/A. CLC is not specified in this recommendation.	N/A
192	Methods for Measuring Market Effects of Massachusetts Energy Efficiency Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-34	Electric/Gas	2014-34-1	The market effects cross-cutting team should identify specific methods and data needed for measuring market effects in the high-priority program-market intersections identified through this work.	Statewide	Yes							
193	Methods for Measuring Market Effects of Massachusetts Energy Efficiency Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-34	Electric/Gas	2014-34-2	Market effects work should use the established evaluation approaches identified in this document.	Statewide	Yes							
194	Recommended Methods for Assessing Market Effects of HVAC Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-35	Electric/Gas	2014-35-1	Market effects studies should proceed for Residential HVAC and C&I Upstream HVAC program-market intersections.	Statewide	Yes							
195	Recommended Methods for Assessing Market Effects of HVAC Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-35	Electric/Gas	2014-35-2	PAs should consider establishing a panel of HVAC manufacturers from which to collect market share and other data, as appropriate, for manufacturer-controlled sales channels. The panel would supplement residential Heating, Air-conditioning & Refrigeration Distributors International (HARDI) data (Recommendation 3) and provide some data for commercial equipment other than rooftop units (RTUs). PA program staff could play an active role in helping to design, recruit and retain market actors for this or any other HVAC market actor panel the PAs may want to establish. PA program planning staff and PA and contractor evaluation staff should also provide input to design in addition to market effects. Involving these diverse groups of staff increases the likelihood that manufacturers will participate, that future program plans will leverage market effects or utilize market effects research findings, that data collected through market actor panels will be useful to program design and marketing, and that the data will meet a broader range of evaluation needs beyond just market effects. Additionally, including a diverse group of program and evaluation staff will help ensure that long term relationships are established and well maintained between PAs and manufacturers.	Statewide	Yes							
196	Recommended Methods for Assessing Market Effects of HVAC Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-35	Electric/Gas	2014-35-3	Residential HVAC market effects research can proceed with HARDI data, supplemented by market actor panel and interview data as available and appropriate (Recommendation 2). HARDI data acquisition will need to be renegotiated to ensure that the data to be purchased align with market effects research needs.	Statewide	Currently Under Consideration							
197	Recommended Methods for Assessing Market Effects of HVAC Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-35	Electric/Gas	2014-35-4	PAs should build on the C&I Upstream HVAC Program's existing distributor data collection activities in order to obtain market share data for commercial RTUs. RTU market effects research can proceed with these data as well as additional data that may be collected by market actor panels and interviews. PAs may also wish to explore the viability of obtaining other kinds of market data through a panel of C&I distributors, most likely building on the Upstream HVAC program's existing relationships with distributors. Any data collection involving HVAC distributors would need to be carefully planned to complement, not duplicate or conflict with, market share or other market data to be obtained through HARDI or manufacturers, and not jeopardize the PAs' ability to obtain HARDI data.	Statewide	Currently Under Consideration							
198	Recommended Methods for Assessing Market Effects of C&I Lighting and Controls Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-36	Electric	2014-36-1	C&I Lighting market effects research can proceed with a study of the market effects of programs that promote high-performance (HP) T8 lamps and ballasts, including quantification of net savings attributable to those programs.	Statewide	Yes							
199	Recommended Methods for Assessing Market Effects of C&I Lighting and Controls Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-36	Electric	2014-36-2	The PAs should assess the potential value of developing a baseline study on lighting controls. C&I Lighting Controls should be monitored for any significant uptick in activity, which would suggest value to a market effects study. However, no market effects study is warranted at this time.	Statewide	Yes							
200	Recommended Methods for Assessing Market Effects of Non-residential New Construction Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-37	Electric/Gas	2014-37-1	The PAs should consider conducting prospective work involving the tracking of indicators that would support theory-based evaluation.	Statewide	Will Consider for Future Studies							
201	Recommended Methods for Assessing Market Effects of Non-residential New Construction Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-37	Electric/Gas	2014-37-2	The PAs should consider using the net-to-gross estimates from the electric and gas net-to-gross (NTG) studies for the 2016-18 prospective estimate that is required for planning purposes. The NTG estimates from these studies are based on self-reporting by program participants and address only free ridership and some form of spillover, not including market effects.	Statewide	Yes							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
202	Recommended Methods for Assessing Market Effects of Non-residential New Construction Programs	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-37	Electric/Gas	2014-37-3	PAs should gather C&I "True" New Construction data through 2017, and aim to complete a retrospective market effects evaluation by early 2018, and at the same time develop a prospective NTG estimate for the 2019-2021 period. Coordination with Codes & Standards evaluation research is essential in this market space, and any resulting savings should be split between the C&I New Construction Program and Codes & Standards, with above-code or above-prevailing practice savings attributed to the former and savings from getting buildings closer to code or prevailing practice attributed to the latter.	Statewide	Will Consider for Future Studies							
203	Cross-Cutting Code Compliance Support Initiative Evaluation Reports	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-38	Electric/Gas	2014-38-1	Provide handouts of the slides used in the trainings to the attendees.	Statewide	Yes							
204	Cross-Cutting Code Compliance Support Initiative Evaluation Reports	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-38	Electric/Gas	2014-38-2	Continue to monitor response times to Circuit Rider calls and work to improve them; response times will become more important as more calls come in concerning current projects.	Statewide	Yes							
205	Cross-Cutting Code Compliance Support Initiative Evaluation Reports	Special & Cross Sector Studies	2014 Plan year	App. 4D, Study 14-38	Electric/Gas	2014-38-3	Encourage the use of telephone calls rather than email to submit Circuit Rider questions and receive responses whenever possible.	Statewide	Yes							
206	Northeast Residential Lighting Hours-of-Use Study	Residential	2013 Plan Year	App. 4D, Study 13-1	Electric/Gas	2013-1-1	The Team recommends that the Sponsors consider adopting the HOU room-by-room estimates from the overall hierarchical model for all households regardless of income or home type.	Statewide	No, The PAs are investigating the cost and capability of adopting and tracking the data required to adopt this recommendation at this time. The PAs will continue to explore opportunities to improve data and reporting on lighting in the 2016-2018 plan, but since all available sockets are targeted, they do not intend to track bulbs by room at this time.							
207	Northeast Residential Lighting Hours-of-Use Study	Residential	2013 Plan Year	App. 4D, Study 13-1	Electric/Gas	2013-1-2	As with HOU estimates, the team recommends that the Sponsors consider adopting the Overall load curve and resulting coincidence factors across Connecticut, Massachusetts, Rhode Island, and Upstate New York.	Statewide	Yes							
208	Northeast Residential Lighting Hours-of-Use Study	Residential	2013 Plan Year	App. 4D, Study 13-1	Electric/Gas	2013-1-3	Consider higher HOU estimates for retrospective studies.	Statewide	Yes							
209	Massachusetts Residential New Construction Net Impacts Report	Residential	2013 Plan Year	App. 4D, Study 13-2	Electric/Gas	2013-2-1	Assess the net impacts of the Program's multifamily component.	Statewide	Currently Under Consideration							
210	Massachusetts Residential New Construction Net Impacts Report	Residential	2013 Plan Year	App. 4D, Study 13-2	Electric/Gas	2013-2-2	Continue to conduct baseline studies of non-program homes.	Statewide	Currently Under Consideration							
211	Massachusetts Residential New Construction Net Impacts Report	Residential	2013 Plan Year	App. 4D, Study 13-2	Electric/Gas	2013-2-3	Continue to emphasize practices such as quality insulation installation in trainings.	Statewide	Yes							
212	Massachusetts Residential New Construction Net Impacts Report	Residential	2013 Plan Year	App. 4D, Study 13-2	Electric/Gas	2013-2-4	Continue to carefully document any and all program actions that may affect the market.	Statewide	Yes							
213	Massachusetts Low Income Metering Study	Low-Income	2013 Plan Year	App. 4D, Study 13-3	Electric/Gas	2013-3-1	No formal recommendations were made by the evaluators conducting this study.		N/A							
214	Massachusetts Combined Heat and Power Program Impact Evaluation 2011-2012	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-4	Electric	2013-4-1	The PAs should continue to develop and implement a consistent modeling protocol for all sites and across all PAs.	Statewide	Yes							
215	Massachusetts Combined Heat and Power Program Impact Evaluation 2011-2012	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-4	Electric	2013-4-2	The PAs and EEAC Consultant(s) should continue to work together to define the attribution of savings to CHP systems.	Statewide	The attribution of savings have been defined since the publication of this study. PAs are currently operating under common agreement.							
216	Massachusetts Combined Heat and Power Program Impact Evaluation 2011-2012	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-4	Electric	2013-4-3	The PAs should collect metered data for at least two years after system commissioning. Data collected during the second year would provide a sufficient buffer for any metering outages during the first year and ensure twelve months of valid data would be collected.	PA Specific		Yes	No. While Eversource will continue to make metering a requirement for CHP participation, the requirement for data collection will be shifted from the program administrator to the customer.	N/A, electric only	N/A	N/A	Currently Under Consideration	The Company does very few CHP projects, and will consider recommendation on case by case basis.
217	Massachusetts Combined Heat and Power Program Impact Evaluation 2011-2012	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-4	Electric	2013-4-4	The PAs and EEAC Consultant(s) should consider conducting a future evaluation focused on medium, large, and district sized systems. These planned systems may significantly change realization rates for the program when they become operational.	Statewide	No. PAs will consider this for future studies.							
218	Massachusetts Combined Heat and Power Program Impact Evaluation 2011-2012	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-4	Electric	2013-4-5	In order to obtain a more thorough understanding of the engineering analysis and the commissioning process, the PAs and EEAC Consultant(s) should consider conducting a process evaluation of the CHP program.	Statewide	Yes. This has been considered and PAs are scoping this as a study during the 2016-2018 timeframe.							
219	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-1	Increase recruitment and training of energy services firms able to provide comprehensive solutions - The PAs could better serve this market by establishing a system for recruiting and training qualified vendors to service mid-size customers. PAs should look for ways to facilitate partnerships between firms to get the right skill sets, or to develop a broader internal base of expertise.	PA Specific	PAs plan to incorporate recommendations	Yes	Yes. Eversource regularly utilizes energy services firms referred to as project expeditors as one way to reach the mid-sized customer segment.		Currently under consideration	Currently under consideration	Yes	Currently under consideration

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
220	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-2	Develop a statewide process for qualifying and coordinating energy services firms to provide comprehensive solutions – There is a need for greater access to qualified contractors to service the diverse needs of mid-size customers.	Statewide	Currently Under Consideration							
221	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-3	Lower capital and administrative costs for mid-size customers and/or contractors to improve payback and margin on energy efficiency investment- While higher incentives may not be possible on many custom projects, the PAs could establish programs that increase financing options and qualifying costs to energy services firms.	PA Specific		Yes	Yes	Yes	Yes	Yes	Yes	Yes
222	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-4	Increase multi-measure (comprehensive) program offerings – The PAs should review their existing comprehensive program offerings to ensure they offer incentives for multiple measures, or change the program offerings to address untapped measures.	Statewide	Yes							
223	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-5	Continue to improve marketing strategies for mid-market – These efforts should include use of PEX contractors to assist in identifying the appropriate solutions for customers. In addition, these strategies should focus staff on strategic segments of customers with similar energy needs. Segmenting by industry is one approach to creating a targeted marketing process.	Statewide	Yes							
224	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-6	Support energy services firms by obtaining qualifying information – The PAs could require contractors to administer simplified system inventory and gas service provider surveys when scheduling visits. Information collected by these surveys could be used to rate contractors on their thoroughness in marketing programs.	Statewide	No, the PAs do not agree with this recommendation and we will look for more cost-effective ways to optimize trade ally management							
225	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-7	Standardize approaches to marketing to multi-account customers – Identifying a successful approach and standardizing it will improve the PA's ability to effectively market to those customers.	Statewide	Yes							
226	Mid-size Customer Needs Assessment	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-5	Electric/Gas	2013-5-8	There is a need to link electric and gas customers – Because identification and marketing to Direct Install customers is handled through the electric PAs, the gas-only PAs lose some autonomy regarding how their customers are marketed.	statewide	Currently Under Consideration							
227	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-1	LED Delta Watts –Wattage for baseline bulbs/lamps was found to be significantly higher than tracking estimates, mostly due to the fact that tracking estimates assumed a higher mix of CFLs than was found. As market penetration of LEDs increase baseline wattage will decrease. A follow-up evaluation should consider this shifting baseline as a factor in deciding when the next one should take place.	Statewide	Yes							
228	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-2	Quantity - This study found that approximately 82% of the purchased LED lamps and approximately 80% of the purchased fluorescent lamps were installed at the time of the evaluation. It was common to find many of these not yet installed lamps in storage at each of the facilities. It is unclear what the lag time will be for the installation of these remaining lamps, and therefore, a follow-up study should be designed to revisit sites from this study that had a large number of units still in storage or not yet installed.	Statewide	Yes							
229	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-3	Hours of Use - This study found that the hours of use realization rate was 88% for LEDs and 103% for fluorescent lamps. Based on lighting logger data at each of the sites, the average hours of use for LED lamps were found to be 3,979 hours per year and 3,559 hours per year for fluorescent lamps. It is recommended that the hours of use for each technology be adjusted appropriately to account for this finding for the near term.	Statewide	Yes							
230	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-4	Increase the Customer's Awareness of the Program - Many customers were aware that they had received discounted lamps from this program, but not all were aware that the discounts came from the PAs. Many customers were under the impression that their electrical contractors were offering the deep discounts. It is recommended that the PAs consider utilizing a program sticker or label that participating distributors would attach to a customers' shipping/purchase order.	Statewide	Currently Under Consideration							
231	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-5	Additional Supporting Information for Large Purchases - It is recommended that electrical contractors or end users be required to provide more information to support extremely large purchases so that it would be more likely that the program bulbs are installed earlier.	Statewide	Yes							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
232	Impact Evaluation of the Massachusetts Upstream Lighting Program	Commercial & Industrial Program Studies	2013 Plan Year	App. 4D, Study 13-6	Electric	2013-6-6	Follow-up Impact Evaluation - This impact evaluation provides important feedback to the PAs for reporting savings, and improving savings estimates. However, due to the relatively large error ratios found in this study, the targeted 90/10 precision was not achieved. Depending on PA needs, a follow-up study may be considered to improve the evaluation results, or to obtain statistically valid factors for some of the building types where a majority of LED and Fluorescent lamps are being installed. The PAs and EEAC may want to consider performing a third phase of impact evaluation, which could be designed in consideration of the error ratios that were found with this study to try to achieve a combined 90/10 precision at the measure category, or targeted at a measure category and building type. Alternatively, the PAs and EEAC may consider following up on those sites with lower installation rates. Follow-up discussion and long-term planning should take place to determine what the evaluation needs are on an ongoing basis, and also what the target precision levels should be based on the needs of the PAs and EEAC.	Statewide	Yes							
233	Evaluation of the Northampton Leading the Way and Powering Pittsfield Initiatives	Special & Cross Sector Studies	2013 Plan Year	App. 4D, Study 13-7	Electric/Gas	2013-7-1	No formal recommendations were made in this evaluation.		N/A							
234	2013 Massachusetts Statewide Marketing Campaign Evaluation Report	Special & Cross Sector Studies	2013 Plan Year	App. 4D, Study 13-8	Electric/Gas	2013-8-1	There were no recommendations from this report, as it was designed to assess the performance of the marketing campaign and attitudes toward the aforementioned statewide brands.		N/A							
235	Abbreviated Review of Methods for the Draft Top-Down Modeling Methods Study	Special & Cross Sector Studies	2013 Plan Year	App. 4D, Study 13-9	Electric/Gas	2013-9-1	No formal recommendations were made in this literature review. Instead, the pros and cons of various methods were reviewed.		N/A							
236	Efficient Neighborhoods+SM – Summary of Evaluation Results	Special & Cross Sector Studies	2013 Plan Year	App. 4D, Study 13-10	Electric/Gas	2013-10-1	No formal recommendations were made.		N/A							
237	2013 Massachusetts Statewide COOL SMART/GasNetworks Brand Assessment	Special & Cross Sector Studies	2013 Plan Year	App. 4D, Study 13-11	Electric/Gas	2013-11-1	There were no recommendations from this report as it was designed to explore awareness and associations between the three subject statewide brands, and assess effectiveness of branding efforts.		N/A							
238	MA RNC Program Incremental Cost Report	Residential	2012 Annual Report	App. C, Study 1	Electric/Gas	2012-1-1	No recommendations were offered. The report provides estimates of the incremental costs per square foot involved in building high efficiency homes that meet the criteria of the 2013 MA Residential New Construction (RNC) Program.		N/A							
239	2012 Residential Heating, Water Heating and Cooling Equipment Evaluation: Net-to-Gross, Market Effects, and Equipment Replacement Timing	Residential	2012 Annual Report	App. C, Study 2	Electric/Gas	2012-2-1	The evaluators want to acknowledge the lack of consensus on NTG algorithms, and recommend that the PAs and EEAC develop clear protocols across all residential and non-residential program categories to look at NTG issues more holistically.	Statewide	No, however the PAs have improved methods in subsequent studies and are considering undergoing an initiative in the Cross Cutting Sector to encourage methodological consensus.							
240	HES Realization Rate Results Memo	Residential	2012 Annual Report	App. C, Study 3	Electric/Gas	2012-3-1	No recommendations were offered. The objective of the evaluation was to develop realization rates (the ratio of ex ante and ex post savings) that each Program Administrator (PA) could use to adjust insulation and air-sealing savings.		N/A							
241	Massachusetts Consumer Survey Results Winter-2007	Residential	2012 Annual Report	App. C, Study 4	Electric	2012-4-1	The evaluators suggest continued tracking of CFL satisfaction throughout future consumer surveys in order to see if satisfaction remains stable in the post-EISA period, when CFLs will face serious competition from less efficient screw-in halogen bulbs and very efficient and long-lasting screw-in LED bulbs.	Statewide	Yes							
242	Massachusetts Consumer Survey Results Winter-2007	Residential	2012 Annual Report	App. C, Study 4	Electric	2012-4-2	Despite evidence that some consumers are having difficulties finding 100-Watt incandescent bulbs on store shelves, one-half of shoppers for these bulbs were able to buy them. Therefore, if they are not already doing so, when developing energy and demand savings assumptions post-EISA, the PAs should consider assuming that the former "baseline" incandescent bulbs will remain available for at least one year and not adjust their delta Watts to account for lower energy use of halogens or other bulb types until after that year.	Statewide	Yes							
243	Residential Lighting Shelf Survey and Pricing Analysis	Residential	2012 Annual Report	App. C, Study 5	Electric	2012-5-1	This study did not offer any recommendations. The evaluation involved the performance of a light bulb shelf-stocking survey and a hedonic pricing regression analysis. The results of the shelf-stocking survey demonstrated that participating stores carry a greater proportion of energy-efficient CFLs and LEDs over incandescent or halogen bulbs.		N/A							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
244	Lighting Retailer, Supplier Perspectives on the Massachusetts ENERGY STAR Lighting Program	Residential	2012 Annual Report	App. C, Study 6	Electric	2012-6-1	The study did not offer any recommendations. There are no recommendation conclusions, the study relied on ten in-depth interviews with lighting manufacturers and high-level retail buyers as well as telephone surveys with 240 participating store managers. Interviewees and survey respondents were asked questions about the lighting market, their experience with the program, changing lighting technology, and their estimation of the impacts of EISA.		N/A							
245	Results of the Massachusetts Onsite Lighting Inventory	Residential	2012 Annual Report	App. C, Study 7	Electric/Gas	2012-7-1	Continue tracking the Massachusetts lighting market through regular consumer surveys, onsite saturation studies, shelf stocking surveys, and supplier interviews.	Statewide	Yes							
246	Results of the Massachusetts Onsite Lighting Inventory	Residential	2012 Annual Report	App. C, Study 7	Electric/Gas	2012-7-2	The PAs should perform a net-to-gross study as one has not been performed since 2010. This study will help to clarify whether current program-supported sales are helping to prevent backsliding to incandescents or incandescent halogen bulbs or whether they represent a high amount of free ridership.	Statewide	Yes							
247	Massachusetts ENERGY STAR® Lighting Program: Early Impacts of EISA	Residential	2012 Annual Report	App. C, Study 8	Electric	2012-8-1	The PAs should track the lighting markets in select comparison areas with varying levels and models of residential lighting programs.	Statewide	Yes							
248	Massachusetts ENERGY STAR® Lighting Program: Early Impacts of EISA	Residential	2012 Annual Report	App. C, Study 8	Electric	2012-8-2	The PAs should continue rebates for standard CFLs and LEDs at least through 2015 (one year after 40- and 60-Watt incandescent phase-out) in order to keep more energy-efficient bulbs on shelves and prevent backsliding of the market to halogen incandescents.	Statewide	Yes							
249	Massachusetts ENERGY STAR® Lighting Program: Early Impacts of EISA	Residential	2012 Annual Report	App. C, Study 8	Electric	2012-8-3	The PAs should continue efforts to educate consumers about new lighting terminology such as lumens and light temperature, how to select the best bulb, and the variety of highly energy-efficient light bulbs available to meet residential lighting needs.	Statewide	Yes							
250	2012 Home Energy Services Pre-Weatherization Initiative Evaluation	Residential	2012 Annual Report	App. C, Study 9	Electric/Gas	2012-9-1	The evaluators suggest that the PAs should work closely with their lead vendors to determine the long-term viability and effectiveness of the turnkey option.	Statewide	The PAs worked with their lead vendors to determine the long-term viability of a turnkey option. Due to a lack of interest in the contractor community, as noted in the evaluation, the PAs determined that a turnkey option was not the optimal long-term solution. The incentive is now customer driven.							
251	2012 Home Energy Services Pre-Weatherization Initiative Evaluation	Residential	2012 Annual Report	App. C, Study 9	Electric/Gas	2012-9-2	The evaluators suggest that the PAs identify ways to better communicate what the cost of checking knob and tube actually covers and how it differs from the cost to actually replace the knob and tube wiring.	Statewide	The PAs worked with their lead vendors to provide further training on these incentives for the energy specialists and electricians.							
252	2012 Home Energy Services Pre-Weatherization Initiative Evaluation	Residential	2012 Annual Report	App. C, Study 9	Electric/Gas	2012-9-3	The evaluators suggest that the PAs consider a compromise deadline of 45 or 60 days that keeps some of the benefits of the immediacy of the deadline, but makes it more realistic for customers to meet the deadline.	Statewide	In an effort to standardize design and delivery, the PAs have adopted a 60 day deadline for acceptance of the incentive.							
253	2012 Home Energy Services Pre-Weatherization Initiative Evaluation	Residential	2012 Annual Report	App. C, Study 9	Electric/Gas	2012-9-4	While some variation may be necessary, the evaluators suggest that the PAs should discuss these variations, determine best practices, and standardize design and delivery as much as possible across the state.	Statewide	The PAs have standardized both the levels and the timing of pre-weatherization barrier incentives across the state.							
254	Residential Lighting Controls Initiative Evaluation	Residential	2012 Annual Report	App. C, Study 10	Electric	2012-10-1	Due to the inconclusive findings, the evaluation did not include formal recommendations.		N/A							
255	Status of Ongoing Low Income Lighting and Heating Metering Study	Low-Income	2012 Annual Report	App. C, Study 11	Electric/Gas	2012-11-1	No recommendations were offered, but the status memo does state that future low income impact evaluations should include secondary heating fuels when estimating total program savings.		N/A							
256	Massachusetts Small Business Direct Install: 2010-2012 Impact Evaluations	Commercial & Industrial	2012 Annual Report	App. C, Study 12	Electric/Gas	2012-12-1	Based on the Pre- and Post-Installation Lighting Occupancy Sensor study: the wide-ranging patterns of pre-installation HOU, including some lighting systems that operated less frequently before the controls were installed, were a surprise to the PAs and the evaluators, and were only detected with pre-installation metering. For future evaluations of control-based efficiency measures, the PAs should continue to perform pre- and post-installation metering studies in order to capture the true impacts.	Statewide	The PAs will consider this recommendation for future studies.							
257	Massachusetts Small Business Direct Install: 2010-2012 Impact Evaluations	Commercial & Industrial	2012 Annual Report	App. C, Study 12	Electric/Gas	2012-12-2	Based on the Billing Analysis: If the PAs are to continue using billing analysis as a method for estimating savings achieved by the SBDI Program, we strongly recommend that more detailed information be collected from program participants, particularly building occupancy and vacancy. If obtaining such data is not feasible, the evaluators recommends that the PAs consider only using billing analyses in cases where it is highly unlikely that any exogenous factors correlate with the implementation of energy conservation measures. In practice, billing analyses would likely only be appropriate in cases where participants are highly homogenous and have consistent patterns of consumption (e.g., all participant buildings are government offices).	Statewide	The PAs will consider this recommendation for future studies.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
258	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-1	Many VSDs are installed but never utilized. The motors were observed to operate at 60 Hz after the installation. Post-inspections should be performed to ensure that automatic controls are installed as required by the prescriptive applications.	Statewide	Yes. PAs have increased post-inspection efforts on drive installs in light of these recommendations.							
259	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-2	VSD installation dates were found to vary significantly from installation of control sequences. In the majority of installations, the VSD was installed several weeks or months before any type of control sequence was implemented. During this period VSDs would typically operate at 60 Hz. The standard protocol for this evaluation was to await confirmation of the controls installation rather than encourage the installation by calling for updates. In some cases DMI installed kW meters for the pre-retrofit condition, but VSDs were never installed. It is recommended that a six-month follow-up is performed before the full incentive is paid so that proper operation can be confirmed.	Statewide	No. PAs have increased post-inspection efforts in an effort to ensure proper drive installation and operation, however, PAs feel that this issue can be remedied without withholding incentive payments.							
260	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-3	Multiple instances were observed in which the VSD retrofit was replacing an existing drive. In all of these cases, the facility operator reported that the existing drives were failing and had operational issues. It appeared that these failing VSDs were approximately 15 years old or more. The prescriptive VSD application states that incentives are not available to VSDs replacing existing drives. Evaluated savings for two of these installations were found to be small or even zero based on metering data. It is recommended that a pre-inspection is done to identify whether or not an existing VSD is being replaced.	Statewide	Yes. Pre-inspections are frequently done as part of prescriptive drive project execution though inspecting all applications received for prescriptive drives is not currently done.							
261	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-4	In at least one case energy savings resulted primarily due to proper balancing rather than VSD control of the motor. Prior to the VSD retrofit, a chilled water pump was providing an excess of water to end users and the motor was observed to operate at over 100% load. The VSD installation was used to essentially balance the chilled water flow. This resulted in significant energy savings, the majority of which could have been achieved simply through balancing and without installation of a VSD. It is recommended that a pre-inspection be done to identify cases in which a VSD might not be the most economical solution.	Statewide	Yes. Pre-inspections are frequently done as part of prescriptive drive project execution though inspecting all applications received for prescriptive drives is not currently done.							
262	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-5	Even though the energy realization rate of 94% was good for a program like this, the individual metered VSD energy realization rates varied from -2% to 407%. The -2% case was the only one that was negative, but 15 drives had a realization rate less than 100%. The remaining 10 drives had a realization rate greater than 100%, and in most cases, they were significantly greater. It is recommended that this realization rate be applied to the TRM energy savings estimates as an immediate step.	Statewide	Yes.							
263	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-6	The MA PAs and EEAC should also look to improve upon the motor level savings assumptions following the completion of the current Load Shape study expected to be completed in late 2013. This study includes post-installation metering on hundreds of drives, which would help to refine the TRM savings assumptions for certain motor, and possibly building types.	Statewide	Yes. The results of the VSD loadshape study were incorporated into prescriptive VSD savings algorithms for purposes of determining coincident winter and summer kW savings.							
264	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-7	The TRM claims summer kW reductions for hot water pumps and winter kW reductions for chilled water pumps. In most cases, hot water pumps were observed to be shut down for the summer months and chilled water pumps shut down for winter months. It is not expected that this would apply to all of these motor types, but based on the sample observed in this evaluation, it appears that the TRM should be adjusted downwards. Currently, it appears that the TRM assumes 100% of these motors will operate during their off-seasons. It is recommended that the TRM be reviewed, and appropriate adjustments be made to ensure that demand savings are realistic for certain measure types. Consider near-zero summer kW reduction for hot water pumps and near-zero winter kW reduction for chilled water pumps.	Statewide	No. The results of the VSD loadshape study were leveraged for purposes of revising summer and winter kW reductions.							
265	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-8	Summer On-Peak kW reductions in the TRM are generally very close to zero for motor types not related to heating. This seems to be a reasonable assumption for motors with automatic controls as it would be expected that an appropriately-sized motor would operate near full load on a design day; however, the evaluation observed significantly more motors with manual controls than expected, with the motors operating below full-load input kW. Since the TRM predicts near-zero summer kW reductions, this results in very high realization ratios. . It is recommended the PA's examine the TRM summer On-Peak kW reduction values for accuracy.	Statewide	Yes. Summer kW values were examined and consequently updated. The VSD loadshape study was leveraged for this purpose.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
266	Impact Evaluation of 2011-2012 Prescriptive VSDs	Commercial & Industrial	2012 Annual Report	App. C, Study 13	Electric	2012-13-9	It is not recommended that the realization rates for demand savings from this study are applied to the TRM due to the poor precisions. However, we think that the observations noted above can be used to improve upon the savings estimates in the TRM.	Statewide	Yes. The VSD loadshape study was leveraged for purposes of developing kW reduction values.							
267	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-1	For future lighting impact evaluations, three month data collection should be sufficient to estimate annual energy savings. It is recommended that the PAs consider monitoring for a minimum of three months. Also consider including a winter or summer month in that period if possible.	Statewide	Yes							
268	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-2	It is recommended that the lighting systems component of the TRM be updated to reflect these new results.	Statewide	Yes							
269	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-3	It is recommended that the PAs continue to use site specific data when estimating lighting hours of use.	Statewide	Yes							
270	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-4	Depending on the outcome of the current lighting controls market study, a pre/post metering lighting controls study may be needed in the future.	Statewide	The PAs will consider this recommendation for future studies.							
271	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-5	To help implementation and TA vendors and produce more reliable estimates of hours reduced, it is recommended that the PAs consider requiring pre-installation metering to establish an estimate of baseline hours.	Statewide	No, The PAs do not agree with this recommendation. The additional cost and time of pre-metering prescriptive lighting projects would act a potential barrier for customer participation and add costs to both the Customer PAs.							
272	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-6	Until a new pre/post lighting controls impact evaluation is done, it is recommended that the lighting controls component of the TRM be updated to reflect these new results.	Statewide	Yes							
273	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-7	It is recommended that for all Advanced Lighting Design projects, the PAs try to collect the final lighting as-built, which would be used to adjust the proposed connected kW savings.	Statewide	Yes							
274	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-8	It is recommended that the PAs and EEAC consider updating the TRM using these realization rates and savings factors.	Statewide	Yes							
275	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-9	This report recommends that the TRM be updated to utilize a refrigeration system efficiency of 1.9 kW/Ton. This value is based on a larger proportion of lower temperature freezer cases than cooler cases found in these applications.	Statewide	Yes							
276	Impact Evaluation of 2010 Prescriptive Lighting Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 14	Electric	2012-14-10	It is recommended that in all future freezer/cooler case LED lighting applications, lighting controls be considered.	Statewide	Yes							
277	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-1	Make sure customers and TA vendors understand they need to be prepared to provide assistance if their project is selected for evaluation.	Statewide	Yes							
278	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-2	Ensure sufficient time is allowed for logging data for projects with seasonal variability.	Statewide	Yes							
279	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-3	All PAs should require more complete pre-retrofit or baseline documentation.	Statewide	Yes							
280	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-4	PAs should work together to require consistent methodologies and documentation for similar projects across different PAs.	Statewide	Yes							
281	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-5	Consider specifying documentation requirements for compressed air leak repairs.	Statewide	Yes							
282	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-6	Consider more of a whole system approach for grouping measures for evaluation.	Statewide	Yes							
283	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-7	Require TA vendors to provide metering for retrofit projects.	Statewide	No, the PAs do not agree with this recommendation blanketed across all projects because it has the potential to drive additional cost without additional savings. The PAs do however agree that on a case by case basis metering is warranted.							
284	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-8	Consider specifying TA verification of savings via commissioning, and in some cases, pre/post metering for specific measures.	Statewide	Yes							
285	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-9	Perform closer review of large savings measures.	PA Specific			Yes.		Yes	Yes	Yes	Yes
286	Impact Evaluation of 2011 Custom Refrigeration, Motor and Other Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 15	Electric	2012-15-10	Include interactive refrigeration savings.	PA Specific			Yes.		Yes	Yes	Yes	Yes

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil

Statewide	Will Consider for Future Studies							
299	Customer Profile Project	Commercial & Industrial	2012 Annual Report	App. C, Study 17	Electric/Gas	2012-17-4	Incorporate checks to ensure that account numbers entered into tracking systems are accurate, and correspond to those in billing systems.	Statewide	Yes							
300	Customer Profile Project	Commercial & Industrial	2012 Annual Report	App. C, Study 17	Electric/Gas	2012-17-5	If there is a need for more reliable information by business type, explore services and software to use names and addresses to lookup business type rather than relying on PA designations.	Statewide	Currently Under Consideration							
301	Customer Profile Project	Commercial & Industrial	2012 Annual Report	App. C, Study 17	Electric/Gas	2012-17-6	Build on this one year snapshot with additional data going forward to accumulate program participation history.	Statewide	Yes							
302	Mid-Sized Customer Needs Assessment - Interim Results	Commercial & Industrial	2012 Annual Report	App. C, Study 18	Electric/Gas	2012-18-1	Improve processes for linking multiple accounts to customers – The PA's ability to accurately and consistently classify customers depends upon their ability to track multiple account customers within and across PAs. The PAs employ a range of tools to help them link customers; however, these tools did not provide sufficient support to enable the research team to link account representatives to the accounts they manage by account number. Moreover, we found large discrepancies between the segments that the PAs felt they were managing and those we were able to match with account representatives.	Statewide	No. These recommendations pertain to interim findings only. PAs feel it appropriate to await recommendations related to the final report.							
303	Mid-Sized Customer Needs Assessment - Interim Results	Commercial & Industrial	2012 Annual Report	App. C, Study 18	Electric/Gas	2012-18-2	Standardize classification and marketing approaches to multi-account customers – The research found that multiple account customers were treated differently across PAs, and also within a PA, across customers. The lack of standardized approaches for treating multiple account customers limits our ability to isolate segments of customers based on size and complicates the PA's ability to effectively market to those customers.	Statewide	No. These recommendations pertain to interim findings only. PAs feel it appropriate to await recommendations related to the final report.							
304	Mid-Sized Customer Needs Assessment - Interim Results	Commercial & Industrial	2012 Annual Report	App. C, Study 18	Electric/Gas	2012-18-3	Link electric and gas customers – Because much of the identification and marketing to Direct Install customers is handled through the electric PAs, the gas-only PAs lose some autonomy regarding how their customers are marketed. Consequently, some large gas customers are not identified until after they receive Direct Install prescriptive solutions from installation contractors. Improved coordination of tracking systems across PAs would reduce the risk of this occurring. DNV KEMA found that the PA's ability to link accounts across firms is constrained by legal privacy issues that must be addressed before this will be possible.	Statewide	No. These recommendations pertain to interim findings only. PAs feel it appropriate to await recommendations related to the final report.							
305	Impact Evaluation of 2011 Prescriptive Gas Measures	Commercial & Industrial	2012 Annual Report	App. C, Study 19	Gas	2012-19-1	Specific Condensing Boiler Savings (MMBtu) were calculated for different sized boilers from 2010-2012. See study for values.	Statewide	PAs plan to incorporate recommendations							
306	Impact Evaluation of 2011 Prescriptive Gas Measures	Commercial & Industrial	2012 Annual Report	App. C, Study 19	Gas	2012-19-2	Specific condensing furnace savings (MMBtu) were calculated for different furnace efficiencies form 201-2012. See study for values.	Statewide	PAs plan to incorporate recommendations							
307	Impact Evaluation of 2011 Prescriptive Gas Measures	Commercial & Industrial	2012 Annual Report	App. C, Study 19	Gas	2012-19-3	Recommended infrared heater savings (MMBtu) were calculated as 74.4 in 2010, 22.3 in 2011, and 12.0 in 2012.	Statewide	PAs plan to incorporate recommendations							
308	Impact Evaluation of 2011 Prescriptive Gas Measures	Commercial & Industrial	2012 Annual Report	App. C, Study 19	Gas	2012-19-4	Recommended indirect water heater savings (MMBtu) were calculated as 30.4 in 2010, 20.7 in 2011, and 19.0 in 2012.	Statewide	PAs plan to incorporate recommendations							
309	Standard Boiler Research Plan and Interview Results Memo	Commercial & Industrial	2012 Annual Report	App. C, Study 20	Gas	2012-20-1	It is important to note that the initial scoping does not provide conclusive evidence on the absence of standard efficiency boilers in the Massachusetts market, and further research on existing installed stock and recent sales data is warranted.	Statewide	Yes							
310	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-1	Project documentation should include savings estimates in the native file form and support the claimed baseline.	Statewide	Yes							
311	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-2	Controls measures, particularly EMS based strategies, must be verified for proper operation, setpoints, and applicability. Savings estimates for these types of measures should include all necessary assumptions and operating characteristics well outlined. Post verification metering should be considered where savings justify the added expense or be included as a requirement of the project.	Statewide	Currently Under Consideration							
312	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-3	Estimated savings for measures such as combustion controls, which are based on a savings a fixed percentage of total gas used should include not only the percentage savings, but the baseline and projected as-built efficiencies and the billed gas usage. The baseline, if currently installed, should be demonstrated using combustion gas efficiency tests or other measure of the baseline. The resulting parameters can be easily checked against acceptable ranges to validate the measure.	Statewide	Yes							
313	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-4	The evaluators recommend that PA implementers consider using the results of the savings fraction analysis performed as part of the desk review process as a sanity check of individual application savings estimates and as indicator where a deeper review of an application may be required.	Statewide	Yes. Program administrator implementation departments have considered using the savings fraction as an additional metric to determining estimated savings.							

Rec #	Study Name	Sector	Filing/Docket	Study Location and Number	Fuel	Recommendation ID (Year - Study # - Rec #)	Recommendation	PA Specific / Statewide	Did the Program Administrator implement the recommendation (Yes, No & Explain Why not, Currently Under Consideration, Will Consider for Future Studies, N/A))	National Grid	Eversource	CMA	Liberty	Berkshire	CLC	Unitil
314	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-5	Consider some summer metering for measures which involve summer gas use such as industrial processes or re-heat operations.	Statewide	No - The PAs took this recommendation into consideration but have not implemented due to 2 factors; 1) small number of impacted projects in the most recent sample and 2) timing we wanted to make sure we could incorporate the most up-to date results in the 2016-2018 planning process.							
315	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-6	In considering evaluation activities for the PY2012 program, the Evaluation Group may want to consider an additional round of on-site M&V impact evaluations for all the PAs except NSTAR. It is reasonable to conclude that the realization rates may not have stabilized statewide due to the rapid and continued expansion of the programs and the intent of the PAs to improve savings estimate processes.	Statewide	Yes, however the subsequent gas impact evaluation included all gas PAs, including NSTAR.							
316	Impact Evaluation of 2011 Custom Gas Installations	Commercial & Industrial	2012 Annual Report	App. C, Study 21	Gas	2012-21-7	However, before proceeding with the on-site M&Vs, the evaluators recommend repeating the desk-review task to further test the validity of the desk review method for triggering more expensive impact evaluations.	Statewide	Yes. This was completed as part of the subsequent gas impact evaluation.

8. Provide pre-filed testimony describing the process for identifying and studying new non-energy impacts.

Response:

Please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition).

9. Provide pre-filed testimony describing all new non-energy impacts that the Program Administrators anticipate studying during the 2016-2018 term.

Response:

Please see Pre-Filed Testimony of each Program Administrator (available at Exhibit 2 to each PA's Petition).

10. Provide a table defining the following budget categories, including descriptions and examples of each component of the budget category (e.g., define market transformation plans and provide an example of costs associated with these plans):

a. program planning and administration ("PP&A");

b. marketing and advertising;

c. participant incentives;

d. sales, technical assistance, and training; and

e. evaluation and market research.

Response:

a. Program Planning and Administration

Program Planning and Administration ("PP&A") - includes costs associated with developing program plans, including market transformation plans, R&D (excluding R&D assigned to Evaluation and Market Research), day-to-day program administration, including labor, benefits, expenses, materials, supplies, overhead costs, any regulatory costs associated with energy efficiency activities, database/data repository development and maintenance, sponsorships and subscriptions, and energy efficiency services contracted to non-affiliated companies, e.g., outside consultants used to prepare plans, screen programs, improve databases and perform legal services. This category also includes internal salaries for administrative employees/ tasks, including program managers who do not have direct sales and technical assistance contact with customers.

Component	Description	Example of Associated Costs
Developing program plans	Administrative costs, including both internal costs, such as salaries, and costs for services contracted to non-affiliated companies for work on developing programs and drafting the three-year plans	Salaries, consultants with expertise in program design, legal counsel, consultants providing cost-effectiveness screening, vendors performing studies of technical potential
Market transformation plans	Market transformation plans are program designs, strategies, and tactics that are focused on efforts that will lead to long-term changes in the marketplace.	Salaries, consultants with expertise in program design and energy markets, vendors performing studies on market transformation
R&D	Research and Design ("R&D") are efforts to design and plan a specific R&D effort.	Salaries, consultants conducting R&D

Component	Description	Example of Associated Costs
Day-to-day program administration, including labor, benefits, expenses, materials, supplies, overhead costs	Administrative costs related to running energy efficiency programs and meeting regulatory requirements	Salaries, employee benefits, employee education, photocopying
Regulatory costs associated with energy efficiency activities	Costs including both internal costs, such as salaries, and costs for services contracted to non-affiliated companies for satisfying regulatory requirements, including Council meetings, workshops, and reporting, and Department filings and proceedings	GCA required payments to EEAC consultants, DOER assessment, costs to pay for AG expert as requested, hiring of expert consultants, legal fees, filing fees, photocopying, salaries
Database/data repository development and maintenance	Development and maintenance of MassSaveData.com and any additional future database reporting	Payment to third-party vendor
Sponsorships and subscriptions	Industry organizations that support energy efficiency, including information sharing, professional networking, new technologies and strategies, skills development, and best practices, all in furtherance of achieving energy savings.	Membership fees, conference sponsorships

b. Marketing and Advertising

Marketing and Advertising - includes costs for the development and implementation of marketing strategies and costs to advertise – through television, radio, billboards, brochures, telemarketing, web-sites and mailings – regarding the existence and availability of energy efficiency programs or technologies, and to induce customers or trade allies to participate in energy efficiency programs. These costs include internal salaries for employee functions related to marketing and advertising.

Component	Description	Example of Associated Costs
Development and implementation of marketing strategies	Costs, both internal and for agencies with expertise in marketing, advertising, and website development	Salaries and payment to third-party vendors
Costs to advertise	Payments for advertising on television, radio, billboards, brochures, telemarketing, websites, and mailings	Radio ads, MBTA billboards, brochures for conferences, www.masssave.com

c. Participant Incentives

Participant Incentives - includes funds paid by the reporting Program Administrator to or on behalf of customers or trade allies as rebates or in other forms. Participant incentives includes costs that directly benefit customers, including permit fees, pre-weatherization expenses, repairs, and interest buy-down.

Component	Description	Example of Associated Costs
Funds paid by the reporting Program Administrator to or on behalf of customers or trade allies as rebates or in other forms	Funds paid to customers or paid to contractors that reduce costs payable by customers	Rebates and incentives, including upstream incentive programs
Costs that directly benefit customers, including permit fees, pre-weatherization expenses, repairs, and interest buy-down	Funds paid to assist customer with installing energy efficiency measures, including financing and costs associated with fees and services that must be done in order to commence or complete energy efficiency installation	Permit fees, pre-weatherization expenses, repairs, interest buy-down

d. Sales, Technical Assistance, and Training

Sales, Technical Assistance & Training ("STAT") **-** includes administration, sales technical assistance and training costs to motivate: (1) customers to install energy efficiency products and services; (2) retailers to stock energy efficiency products; (3) trade professionals to offer energy efficiency services; (4) manufactures to make energy efficiency products; and (5) use of vendor services and suppliers that demonstrate benefits of energy efficiency. This category also includes costs not directly tied to savings, including residential assessments, technical assistance studies, contractor fees and performance bonuses, vendor cost of money; lead vendor fees and internal salaries for employees with direct customer sales and technical assistance contact.

Component	Description	Example of Associated Costs
Sales	Costs to motivate customers to install energy efficiency products and services; motivate retailers to stock energy efficiency products; trade professionals to offer energy efficiency services; manufactures to make energy efficiency products; vendor services and suppliers that demonstrate benefits of energy efficiency	Salaries, vendor costs, performance bonuses
Technical Assistance	Engineering studies, assessments, measure installation, customer support	Salaries, vendor fees, costs of equipment and assessment, contractor fees

Component	Description	Example of Associated Costs
Training	Costs associated with training sales team to encourage installation of energy efficient measures and/or use of services. Costs associated with training contractors to install appropriate measures properly and perform assessments.	Salaries, vendors that perform trainings

e. <u>Evaluation and Market Research</u>

Evaluation and Market Research - includes costs associated with evaluation activities: costs related to cost-effectiveness evaluation, market research (*e.g.*, baseline studies, market assessments and surveys), impact and process evaluation reports, tracking and reporting program inputs and outputs, funding studies, and other costs clearly associated with evaluating the program. This category also includes internal salaries for employee functions related to evaluating the programs.

Component	Description	Example of Associated Costs
Cost-effectiveness evaluation	Costs associated with evaluating the cost-effectiveness of measures	Internal and third-party vendor costs for study implementation and analysis
Market research	Costs associated with baseline studies, market assessments, and surveys	Internal and third-party vendor costs for study implementation and analysis
Impact and process evaluations	Costs associated with determining best practices and attributable or gross energy savings and benefits of measures	Internal and third-party vendor costs for study implementation and analysis
Tracking and reporting program inputs and outputs	Costs associated with accounting for measures, costs, and attributable and gross savings and the monetized value of those savings	Internal and third-party vendor costs for study implementation and analysis

11. Provide an update to the Consistent Cost Categories Report filed on July 31, 2014. Identify whether: (1) the common definitions of the costs assigned to each of the five categories have been finalized; and (2) all Program Administrators categorize costs in the same way. If costs are not categorized in the same way, explain any remaining discrepancies in the definitions and the reasons for the discrepancies.

Response:

The PAs put significant effort into the Consistent Cost Categories Report filed on July 31, 2014, and have finalized the costs assigned to each of the five categories. The only differences in the cost categories in this Plan as compared to July 31, 2014 are the following:

- Costs related to database/data repository development and maintenance, and associated labor have been moved from Evaluation & Marketing to PP&A. This change was made because the PAs determined that the costs associated with the development of the statewide database/data repository administrative costs related to meeting reporting requirements of stakeholders as opposed to costs associated with verifying measure savings and costs.
- Sponsorships & Subscriptions has been added to the definition of PP&A. This is not a change in categorization, just a clarification to make the definition more complete.
- Development and implementation of marketing strategies has been added to the definition of Marketing and Advertising. This is not a change in categorization, just a clarification to make the definition more complete.

In 2016-2018, the PAs will all categorize costs in the same way, including labor costs. Additionally, PAs have worked to harmonize allocations of costs across hard-to-measure categories for this Plan. The PAs recognize that there may be instances in which differences in cost categorization are discovered in the future, but are committed to consistency and continued improvement. The PAs have established consistent budget cost category definitions, determined methods for allocating salaries across cost categories, and harmonized vendor cost categorization, and are committed to continuing to review new costs and to seek and maintain consistency across PAs throughout the Plan term.

12. Refer to the Consistent Cost Categories Report. For program years 2013 through 2018,[4] provide a breakdown (in dollars) of planned and actual PP&A costs using the following administrative cost sub-categories:

a. development of program plans, including market transformation plans and research and development ("R&D") plans (excluding R&D assigned to evaluation and market research);

b. day-to-day program administration, including labor, benefits, expenses, materials, supplies, and overhead costs;

c. regulatory costs associated with energy efficiency;

d. costs for energy efficiency services contracted to non-affiliated companies such as outside consultants used to prepare plans, screen programs, improve databases, and perform legal services; and

e. internal salaries for administrative employees/tasks, including program managers that do not have direct sales and technical assistance contact with customers.

Response:

Parts (a) through (e) above together represent the definition of the PP&A budget category set forth in the PAs' Cost Categories Report. The PAs include significant detail in their definition in order to set forth specific costs and functions that allow PAs capture the possible costs that are and may in the future belong in this category. Providing a breakdown of costs in this manner, however, would not provide meaningful data, and would not add up to a total PP&A budget because the categories above have significant overlap. For example, costs associated with developing program plans include internal labor costs for full-time employees ("FTE"). An FTE may also work on day-to-day program administration or program management. In addition, some costs associated with PP&A would be excluded using the above definitions, for example, sponsorships & subscriptions, which the PAs have now added in this Plan to the PP&A definition to make the definition more complete. In order to provide useful information to the Department that sums to the total PP&A budget, the PAs are submitting PP&A costs in the following three categories:

- Internal Labor Costs (includes labor, benefits, employee expenses, materials, and overhead) – this subcategory encompasses the Department's request in parts a, b, and e.
- External Costs (includes legal fees, external consultants, and contractors) – this subcategory encompasses the Department's request in parts c and d.
- Administrative Costs Associated with Sponsorships & Subscriptions – this subcategory was not included in the Department's original request, and it was not specified in the PAs' definition for PP&A in the Cost Categories Report submitted on July 31, 2014. The definition of PP&A in this Plan now includes this cost. This category encompasses

[4] Provide planned and actual values for plan years 2013-2015, and planned values for plan years 2016-2018.

administrative costs related to conferences and sponsorships of industry organizations that support energy efficiency, including information sharing, professional networking, new technologies and strategies, skills development, and best practices, all in furtherance of achieving energy savings.

These sub-categories are unique and distinct, such that the sum of the three sub-categories will be equal to the total PP&A cost category.

Please note that due to the PAs efforts to have consistent cost category definitions for the 2016-2018 Plan, it may be difficult to compare historical costs with planned budgets across a single cost category.

Please see Table 12-1 on the following pages for each PA.

Table 12-1: CLC

Year	Reporting Period	Internal Labor Costs (Includes labor, benefits, employee expenses, materials & overhead)	External Costs (Includes legal fees, external consultants and contractors)	Administrative Costs Associated with Sponsorships & Subscriptions	Total PP&A
2013	Planned	$ 501,552	$ 778,717	$ 15,000	$ 1,295,269
2013	Evaluated	$ 284,894	$ 842,908	$ 44,094	$ 1,171,896

Year	Reporting Period	Internal Labor Costs (Includes labor, benefits, employee expenses, materials & overhead)	External Costs (Includes legal fees, external consultants and contractors)	Administrative Costs Associated with Sponsorships & Subscriptions	Total PP&A
2013	Planned	$ 105,628	$ 25,114	*(Note 1)*	$ 130,742
2013	Evaluated	$ 106,129	$ 15,712	$ 703	$ 122,544
2014	Planned	$ 116,355	$ 25,947	*(Note 1)*	$ 142,302
2014	Evaluated	$ 319,633	$ 13,185	$ 2,092	$ 334,910
2015	Planned	$ 127,041	$ 26,644	*(Note 1)*	$ 153,684
2015	YTD (August)	$ 77,074	$ 15,047	$ 550	$ 92,671
2016	Planned	$ 313,784	$ 31,599	$ 7,160	$ 352,543
2017	Planned	$ 320,119	$ 32,578	$ 7,160	$ 359,858
2018	Planned	$ 327,029	$ 33,128	$ 7,000	$ 367,157

1) Unitil did not provide separate budgets for Sponsorships & Subscriptions in its 2013-2015 3 Year Energy Efficiency Plan.

13. Identify all competitively procured contracts that the Program Administrators have already executed for services to be provided during the 2016-2018 term. For each ontract, state the contract term, whether there is an option to extend, and the conditions for renewal. For each Program Administrator, provide the percentage and total dollar amount of competitively procured services that have already been procured for the 2016-2018 term.

Response:

Please see Table 13-1 on the following pages listing statewide and PA-specific contracts that have already been competitively procured for 2016-2018. In addition to this list, several other contracts are out for bid, or in other intermediate stages of competitive procurement.

Additionally, Table 13-2 below shows the percentage and total dollar amount of competitively procured services that have already been procured for the 2016-2018 term for each PA. For contracts that include customer rebate/incentive dollars (which typically account for a significant portion of contracts), PAs have only included the non-incentive portion of the contract, based on historical spending or other planning values. PAs note that these values are planned estimates of a planned budget; actual expenditures will be available at the time of the Term Report.

Table 13-2

Program Administrator	Dollar Amount Already Competitively Procured	% of Planned Competitive Procurement Already Procured
National Grid Electric	$44,266,606.59	34%
Eversource Electric	$67,670,601.46	42%
Cape Light Compact	$2,752,222.49	10%
Unitil Electric	$425,703.85	20%
National Grid Gas	$31,468,133.67	43%
Eversource Gas	$11,332,271.54	48%
Columbia Gas	$6,041,966.15	27%
Berkshire Gas	$997,587.00	25%
Liberty	$166,140.00	11%
Unitil Gas	$151,297.28	23%

Table 13-1

Vendor Name	Initiative/Topic	Statewide or PA-specific	Term	Option to Extend	Conditions for Renewal
"e" Inc	Residential Education	Eversource - Electric	12/31/2017	Y	Option to extend at same pricing
Advanced Energy Group	Small Business Progam	Eversource - Electric & Gas	1/7/2019	N	
AECOM	Small Business Progam	Eversource - Electric & Gas	1/2/2019	N	
AEG	Work Process Management system, license, support, hosting	CMA	8/30/2018	N	
Andelman & Lelak Engineering	Engineering Services	National Grid - Electric & Gas	12/9/2017	Y	Mutual agreement
Andelman and Lelek Engineering	Engineering Services	Eversource - Electric & Gas	5/31/2018	N	
Antares Group	Engineering Services	National Grid - Electric & Gas	11/12/2017	Y	Mutual agreement
Applied Energy Engineering & Commissioning	Engineering Services	National Grid - Electric & Gas	12/9/2017	Y	Mutual agreement
B2Q Associates, Inc.	Engineering Services	National Grid - Electric & Gas	12/18/2017	Y	Mutual agreement
B2Q Associates, Inc.	Engineering Services	Eversource - Electric & Gas	6/1/2018	N	
BGM Experiential	Residential Education	Eversource - Electric	7/31/2017	Y	Option to extend at the same price for one more year
Boyko Engineering	Engineering Services	National Grid - Electric & Gas	12/9/2017	Y	Mutual agreement
C3	CEP	Eversource - Electric & Gas	2/2/2018	Y	Satisfactory Performance
The Cadmus Group	Residential Evaluation	Statewide - All	6/30/2016	N	
The Cadmus Group	Residential Lighting and Residential Products - Marketing	Statewide - Electric	12/31/2017	Y	Currently in Statewide RFP - scores and pricing will determine renewal status
The Cadmus Group	Engineering Services	Eversource - Electric & Gas	6/2/2018	N	
Center for EcoTechnology	HES- Piggyback program with Berkshire	Eversource - Electric	12/31/2016	Y	Piggyback contract for Berkshire Gas territory. We will extend if Berkshire Gas extends for their Lead Vendor services.
Center for EcoTechnology	Residential Multi-Family	Eversource - Electric	6/30/2016	Y	Option to extend at same pricing
CLEAResult	Codes and Standards	Statewide - All	12/31/2016	N	
CLEAResult	Residential Heating and Cooling	Statewide - Electric	12/31/2016	Y	Mutual agreement
CLEAResult	Marketing	CMA	12/31/2016	Y	Mutual agreement
CLEAResult	HES	Eversource - Electric & Gas	12/31/2016	Y	two year renewal option in one year increments

CLEAResult	Residential Multi-Family	Eversource - Electric & Gas	6/30/2016	Y	Option to extend at same pricing
CLEAResult	HES Lead Vendor	National Grid - Electric & Gas	6/30/2016	N	Program will be bid in Q1 - potential redesign around new SW platform
Competitive Resources, Inc. (CRI)	Residential QA/QC Services	Statewide - All	12/31/2016	N	Re-evaluation
Competitive Resources, Inc. (CRI)	Engineering Services	Eversource - Electric & Gas	6/3/2018	N	
CRI (CMC)	Commercial and Industrial Upstream Lighting and HVAC QA/QC	Statewide - Electric	12/31/2016	N

14. Refer to the Consistent Cost Categories Report at 4. For each cost category, identify and provide a full description of the functions that are provided as non-competitively procured activities and functions.

Response:

Functions and Activities - Non-Competitively Procured	
Cost Category	**Description of Function or Activity**
Program Planning and Administration	• Low Income Energy Affordability Network that supports Low Income Networks that PA is required to work with per directive of GCA • Specialized contractors with unique knowledge and skills that assist in program design and provide independent verification of the PAs' internal research and conclusions, verify the most current assessments of industry best practices. • Regulatory assessments and costs, such as DOER assessment, non-affiliated contractors that provide unique and specialized services for program administration and regulatory proceedings, including cost-effectiveness screening and legal services
Marketing and Advertising	• Costs associated with newspaper and magazine advertisements and radio advertising
Sales, Technical Assistance & Training	• Lead Vendor services for low-income programs
Evaluation and Market Research	• Retention of evaluation experts with unique experience and qualifications • PA approved electricians that install monitoring equipment in a customer's facility during an impact evaluation

15. Refer to the Consistent Cost Categories Report at 4. For each cost category, identify and provide a full description of the functions that are provided as competitively procured activities and functions.

Response:

Functions and Activities - Competitively Procured	
Cost Category	**Description of Function or Activity**
Program Planning and Administration	• EEAC Consultants • IT/database projects
Marketing and Advertising	• Statewide marketing agency • PA specific marketing done by external firms • Costs associated with promotional items and supplies
Participant Incentive	• Program Administrators bulk procure energy efficiency measures when possible (e.g., bulbs for all residential programs)
Sales, Technical Assistance & Training	• All vendors associated with program implementation • Contractors who conduct Technical Assistance studies for custom projects
Evaluation and Market Research	• All evaluation contractors working on statewide EM&V activities • Contractor selected to perform regional Avoided Energy Supply Cost ("AESC") study

16. Refer to the Historical Budget Table (Table IV.C 2.2). Add planned values for program years from the previous plan (i.e., 2013-2015).

Response:

Please see the Historical Budget Table in the PAs' Energy Efficiency Data Tables, filed individually by PA as Exhibit 4 to each PA's Petition, and aggregated statewide in Appendix C to this Plan.

17. Provide all narrative and supporting D.P.U. 08-50 tables at the core initiative level and the program level.

Response:

Please see the PAs' Energy Efficiency Data Tables, filed individually by PAs as Exhibit 4 to each PA's Petition, and aggregated statewide in Appendix C to this Plan, for all data at the core initiative, program, sector, and portfolio levels.

18. Provide pre-filed testimony describing the process by which the Program Administrator develops bids for the forward capacity market ("FCM") administered by ISO New England, Inc. ("ISO-NE"), including a discussion of the different timelines of the FCM process relative to the planning process for the plans.

Response:

Please see Pre-Filed Testimony of each electric Program Administrator (available at Exhibit 2 to each electric PA's Petition).

19. Provide pre-filed testimony describing the communication that occurs between the Program Administrator and ISO-NE during the FCM process. Include a description of any limits ISO-NE may place on Program Administrator bids (i.e., capacity limits, measure life, etc.).

Response:

Please see Pre-Filed Testimony of each electric Program Administrator (available at Exhibit 2 to each electric PA's Petition).

20. Provide pre-filed testimony describing the Program Administrator's participation in FCM reconfiguration auctions to date (both annual and monthly), including a discussion of any advantages/disadvantages to participating in these auctions.

Response:

Please see Pre-Filed Testimony of each electric Program Administrator (available at Exhibit 2 to each electric PA's Petition).
