**REQUEST FOR CHANGE IN RATES**

**June 11, 2024**

**Docket No. DE 24-070**

---

1 **I. INTRODUCTION**

2 **Q. Mr. Coates, please state your full name, position and business address.**

3 A. My name is Robert S. Coates Jr. I am the Vice President of Project Management and  
4 Construction for Eversource Service Company ("ESC"). I have, however, been appointed  
5 as President of New Hampshire Electric Operations effective July 7, 2024. My current  
6 business address is 56 Prospect Street, Hartford, Connecticut, but effective July 7, 2024 I  
7 will operate out of 780 North Commercial Street Manchester, New Hampshire.

8 **Q. Please summarize your educational background.**

9 A. I received a Bachelor of Science degree in Occupational Safety and Health Administration  
10 from the University of New Haven. I completed my Master of Business Administration at  
11 American International College.

1 **Q. Please summarize your professional experience.**

2 A. I have been employed by ESC or its affiliates for over 36 years holding various leadership  
3 positions in the safety and electric operation organizations. I have held the position of Vice  
4 President of Project Management and Construction since December 2021 and have been  
5 an Officer for over a decade in Electric Operations. I am responsible for overseeing major  
6 Transmission and Distribution projects and capital construction across the Eversource  
7 Energy service territory, including New Hampshire. In addition, I provide storm restoration  
8 leadership across Eversource, including New Hampshire.

9 **Q. Have you previously testified before the New Hampshire Public Utilities Commission**  
10 **(“PUC” or “Commission”)?**

11 A. I have not testified before the Commission previously, however I have testified in other  
12 cases before the Massachusetts Department of Public Utilities (“MDPU”).

13 **Q. Mr. Renaud, please state your full name, position and business address.**

14 A. My name is Paul R. Renaud. I am the Vice President of Distribution Engineering for ESC.  
15 My business address is 247 Station Drive, Westwood, Massachusetts 02090.

16 **Q. Please summarize your educational background.**

17 A. I graduated from the University of Bridgeport in Bridgeport, Connecticut with a Bachelor  
18 of Science Degree in Electrical Engineering. I subsequently received a Master of Science  
19 Electrical Engineering, Power Systems degree from Northeastern University in Boston,  
20 Massachusetts. I am a registered Professional Engineer in the State of Massachusetts.

1 **Q. Please summarize your professional experience.**

2 A. From 2000 through 2011, I worked for National Grid USA in Waltham, Massachusetts,  
3 where I held lead engineering roles for Transmission Market Development and  
4 Transmission Regulation and Policy areas in 2001 through 2004. In 2005, I became the  
5 Manager for Transmission Asset Strategy and in 2008 through 2011 held the position of  
6 Vice President of Transmission Asset Management and managed the company's  
7 transmission assets in New York and New England. Beginning in 2011, I worked for  
8 Vermont Electric Power Company, where I served as Director of System Planning,  
9 Engineering, and Telecommunication. I provided strategic and day-to-day direction on all  
10 engineering and planning activities related to Vermont's high voltage transmission system.  
11 In March 2014, I was hired by Eversource (then Northeast Utilities) as Vice President of  
12 Massachusetts Engineering. In 2018, I accepted the position as Vice President,  
13 Engineering, for the Eversource Energy electric operating subsidiaries in Connecticut,  
14 Massachusetts and New Hampshire.

15 **Q. Have you previously testified before the Commission?**

16 A. No, I have not.

17 **Q. Mr. Dickie, please state your full name, position and business address.**

18 A. My name is Brian Dickie. I am the Vice President of Electric System Operations in New  
19 Hampshire for ESC. My business address is 780 N Commercial St, Manchester, New  
20 Hampshire 03101.

1 **Q. Please summarize your educational background.**

2 A. I graduated from the University of New Hampshire with a Bachelor of Science in  
3 Engineering Technology and from Worcester Polytechnic Institute with a Master of science  
4 degree in Electrical and Computer Engineering. I am a licensed professional engineer in  
5 the state of New Hampshire, and currently maintain my North American Transmission  
6 Operators (“NERC”) license. I have been a member of IEEE since 2019.

7 **Q. Please summarize your professional experience.**

8 A. I have held various positions with Eversource over the last 35 years from Fossil/Hydro  
9 Operations to distribution engineering and system planning and engineering management.  
10 In 2015, I was promoted to Director of System Operations responsible for transmission and  
11 distribution grid operations, outage management operations, and the troubleshooter  
12 linemen department. In 2021, I was promoted to my current position as Vice President of  
13 New Hampshire Electric System Operations.

14 **Q. Have you previously testified before the Commission?**

15 A. Yes, I have sponsored testimony before the Commission in the 2017 Reliability  
16 Enhancement Program Reconciliation and Request for Program Continuation, DE 09-  
17 035.

18 **Q. Mr. Boutin, please state your full name, position and business address.**

19 A. My name is Warren R. Boutin. I am the Vice President of Customer Grid Electrification  
20 Solutions and Experience for ESC. My business address is 247 Station Drive, Westwood,  
21 Massachusetts 02090.

1 **Q. Please summarize your educational background.**

2 A. I received my Bachelor of Science in Mechanical Engineering from Norwich University  
3 and my Master of Business Administration from Bentley University.

4 **Q. Please summarize your professional experience.**

5 A. I have been employed by ESC for over 30 years. I have held various positions with ESC  
6 including Manager of Electric Strategic Accounts and the Director of Electric Service  
7 Support, Distributed Energy Resources and Supplier Services. I assumed my current  
8 position of Vice President of Customer Grid Electrification Solutions and Experience in  
9 January 2024. In my current position I am responsible for establishing valued business  
10 relationships, providing grid electrification solutions, and a superior customer experience  
11 to the company's strategic accounts, national accounts, large, medium and small customers,  
12 builders and developers, including our Distributed Energy Resource (DER) developers,  
13 Electric Vehicle (EV) customers, third party communication fiber and antenna attachers,  
14 and third-party suppliers.

15 **Q. Have you previously testified before the Commission?**

16 A. No, I have not.

17 **Q. Mr. O'Brien, please state your full name, position and business address.**

18 A. My name is Shamus O'Brien. I am the Director of Voice of the Customer and Customer  
19 Experience Strategy for ESC. My business address is 73 West Brook Street, Manchester,  
20 New Hampshire 03101.

1 **Q. Please summarize your educational background.**

2 A. I received a Bachelor of Arts Degree from Southern New Hampshire University.

3 **Q. Please summarize your professional experience.**

4 A. I have been employed by ESC for over 25 years. I have held various positions, including  
5 Senior Analyst and Manager of Voice of the Customer Team before being promoted to my  
6 current position of Director of Voice of the Customer and Customer Experience Strategy  
7 in September 2022.

8 **Q. Have you previously testified before the Commission?**

9 A. No, I have not.

10 **Q. Ms. Findlay, please state your full name, position and business address.**

11 A. My name is Amy J. Findlay. I am the Manager of Energy Efficiency for ESC. My business  
12 address is 247 Station Drive, Westwood, Massachusetts 02090.

13 **Q. Please summarize your educational background.**

14 A. I graduated from the University of Notre Dame with a Bachelor of Science degree in Civil  
15 Engineering. I received my Master of Business Administration from the University of  
16 Michigan.

17 **Q. Please summarize your professional experience.**

18 A. I have been employed by ESC for over 10 years. I have held various positions at ESC  
19 including Senior Research Analyst for Energy Efficiency and Supervisor of Customer

1 Engagement Strategy for Energy Efficiency before being promoted to my current position  
2 of Manager of Energy Efficiency in April of 2022.

3 **Q. Have you previously testified before the Commission?**

4 A. No, I have not.

5 **Q. What is the purpose of your testimony?**

6 A. The purpose of our testimony is to outline performance based ratemaking (“PBR”) metrics  
7 within the PBR Plan proposed by the Public Service Company of New Hampshire d/b/a  
8 Eversource Energy (“PSNH” or the “Company”) in this proceeding. The electric industry  
9 is experiencing extraordinary challenges influenced by regional energy policy, the  
10 emergence of new technologies, expanding customer expectations and engagement,  
11 challenges in hiring, aging infrastructure and changing weather patterns. Each of these  
12 developments produces unique difficulties for the traditional utility business model. To  
13 address these challenges the Company is proposing to institute a PBR Plan. The joint direct  
14 testimony of Mr. Foley, Mr. Coates and Mr. Horton (“Case Overview Testimony”)  
15 describes the PBR Plan in more detail, including reasons for the Company’s PBR proposal  
16 and how the PBR mechanism is implemented.

17 As part of the PBR Plan, the Company is proposing to establish PBR metrics as part of the  
18 PBR Plan. The purpose of PBR metrics is to motivate the Company to meet targeted  
19 achievements in service quality, active demand response, and customer initiatives and  
20 allow the Commission and stakeholders the ability to monitor the Company’s progress in  
21 these areas during the 4-year PBR term. As discussed below, the Company proposes to

1 implement several individual metrics within certain performance categories that will  
2 provide transparency in relation to the Company's performance.

3 The Company is proposing two different sets of metrics: service quality metrics and  
4 reporting metrics. The service quality metrics are focused on reliability performance and  
5 are designed to ensure that the Company maintains its high service quality standards during  
6 the PBR term and incent the Company to invest in a manner that is cost efficient and  
7 benefits customers through improved reliability and resiliency. The service quality metrics  
8 include Company performance related to System Average Interruption Duration Index  
9 ("SAIDI") and Months Between Interruptions ("MBI"). The Company's proposed service  
10 quality metrics include baselines that if not achieved will result in penalties assessed  
11 against the Company and distributed to customers as a credit in the subsequent year.

12 The reporting metrics are designed with the specific intention of yielding information and  
13 insight into the Company's activities and progress in specific areas of interest. These  
14 metrics cover performance areas including customer satisfaction, solar interconnection,  
15 customer requested work, and active demand response. The Company is proposing a  
16 baseline, or to develop a baseline, for each PBR metric to report its progress over the 4-  
17 year PBR Plan to the Commission and interested parties.

18 **Q. How is your testimony organized?**

19 A. Our testimony is organized into the following sections:

- 20 • Section I includes the introduction;

- 1           • Section II provides the background and purpose of the proposed PBR metrics;
- 2           • Sections III outlines the PBR metrics the Company is proposing for the 4-year PBR
- 3           term, including baselines and targets; and
- 4           • Section IV is the conclusion.

5 **Q. Are you sponsoring any attachments with your joint testimony?**

6 A. Yes. Attachment ES-METRICS-1 includes a table that outlines the category of metric, the  
7 type of measure, the measure, baseline, target, timeline for the target, and the  
8 formula/algorithm for calculation for each PBR metric proposed.

9 **II. BACKGROUND AND PURPOSE OF PBR METRICS**

10 **Q. Please describe the impetus for the Company's proposal to implement a PBR Plan.**

11 A. As described in more detail in the Company's Case Overview Testimony, the Company is  
12 proposing to operate under a PBR Plan to enable the Company to focus on electric  
13 operations, storm response, and obligations to customers without the need for sequential  
14 rate cases. A PBR Plan will allow the Company to impose cost controls to contain  
15 operating and maintenance expenses and to manage capital investment so that financial  
16 integrity is managed within the confines of the PBR Plan. Without the need for successive  
17 rate cases, the Company can remain focused on its performance at all levels of the  
18 organization, which will benefit customers in the long run. Therefore, the interests of  
19 customers are served by a PBR Plan framework.

1 **Q. How do PBR metrics complement and support the Company's PBR Plan?**

2 A. The implementation of meaningful PBR metrics simply furthers the transparency and  
3 effectiveness of the PBR Plan. PBR metrics provide the Company with the focused  
4 objective of creating benefits and value for customers through the targeted achievement of  
5 specific goals and outcomes. A well designed PBR metric encourages improvements in  
6 areas that the Company may not otherwise directly pursue if it is not necessary to fulfill its  
7 basic obligation of safe and reliable service. PBR metrics incentivize the Company to  
8 achieve different specific goals that go above and beyond the efficient delivery of core  
9 business operations.

10 PSNH employs a team of dedicated staff with a strong commitment to providing safe and  
11 reliable electric service to its customers in New Hampshire. The Company is proud of its  
12 ongoing, rigorous efforts to ensure delivery of electric service that is reliable and resilient.  
13 Therefore, the Company thoroughly recognizes that it is important to put metrics in place  
14 to demonstrate performance improvements over the term of its PBR Plan and has worked  
15 diligently to propose metrics that will meet this objective, if approved by the Commission.

16 **Q. Are the proposed PBR metrics consistent with the Company's goals of implementing**  
17 **a PBR Plan?**

18 A. Yes. The Company proposed to implement a PBR Plan to allow PSNH to focus on its  
19 operations without the distraction of multiple rate case filings. Therefore, the proposed  
20 PBR metrics include initiatives that would be difficult to achieve simultaneously when the  
21 Company is faced with multiple rate cases. Implementation of the PBR Plan directly

1 affords the Company the opportunity to focus on these specific areas of operation that  
2 target improvements in resiliency, customer experience, and active demand response.

3 **Q. Please explain how PBR metrics can be an effective tool in the Company's role in**  
4 **promoting policy and customer goals.**

5 A. Incentive regulation can play an important role in aligning a utility's operations with the  
6 broader goals of the Commission, the state of New Hampshire, and the needs of customers  
7 at large. The region is experiencing an emerging retail energy environment that depends  
8 on a reliable, modernized grid, which can be increasingly complex and at times,  
9 unpredictable. The Company must meet these technical challenges while also rising to the  
10 evolving needs and preferences of its customers. PBR metrics are a critical tool that can  
11 be used to promote the Company's focus on making contributions toward realizing energy  
12 goals. This will create greater alignment between the Company's business objectives and  
13 regional and state priorities as well as customer expectations.

14 **Q. How will the Company report on the progress of these PBR metrics to the**  
15 **Commission and other stakeholders?**

16 A. The Company is proposing to report on the progress of the proposed PBR metrics each  
17 year in a filing to the Commission, which can be accessed by interested stakeholders. The  
18 Company will file its yearly PBR metrics report on or before May 15<sup>th</sup> each year, which  
19 will encompass the performance for the calendar year prior. For example, the Company's  
20 first PBR metrics report would be filed on or before May 15, 2027 and would include the  
21 data and performance for calendar year 2026. The Company would continue to report on

1 its performance through these PBR metrics through the end of the PBR term, on or before  
2 May 15, 2029

3 **III. PROPOSED PBR METRICS**

4 **A. Service Quality Metrics**

5 **Q. Please outline the Company's proposed Service Quality metrics.**

6 A. The Company is proposing two Service Quality metrics focused on reliability. The first  
7 reports on the Company's SAIDI, which measures the number of minutes an average  
8 customer can expect to be without power during the year. SAIDI is calculated as System  
9 Average Interruption Frequency Index ("SAIFI") multiplied by the Customer Average  
10 Interruption Duration Index ("CAIDI").

11 The second Service Quality metric reports on the Months Between Interruption (MBI).  
12 This measures the number of months between when an average customer could expect to  
13 experience a sustained power interruption. If, for example, a customer has two  
14 interruptions per year, that is an average of six months between interruptions. System  
15 Average Interruption Frequency Index (SAIFI) is the standard utility, IEEE, and regulatory  
16 measure for frequency of interruptions which is equal to the number of customers  
17 interrupted divided by the number of customers served.

18 
$$\text{SAIFI} = \frac{\text{Total number of customers interrupted}}{\text{Total number of customers served in the group}}$$

19 MBI is a more intuitive way of expressing SAIFI where MBI is equal to a twelve-month  
20 period divided by SAIFI.

$$\text{MBI} = \frac{12}{\text{SAIFI}}$$

**Q. What outage data is excluded from in the proposed Service Quality metrics?**

A. The following outage data is being excluded from the proposed service quality metrics because they are a measure of good utility practice and customer service, or are either out of the Company’s control or do not directly correlate to the resiliency and reliability of the distribution system:

Interruptions that are resolved within 5 minutes or less

Interruption of 5 minutes or less involve events which are resolved in 5 minutes or less which include remote switching utilizing smart switch technology, manual switching performed within 5 minutes or less, and momentary outages which are resolved via inherent functions within the source protective device(s). This customer restoration function is a measure of good utility practice and operations.

Private customer outages

Private customer outages are outages caused by customer equipment beyond the primary or secondary metering.

Planned outages

Planned outages are outages were Eversource will provide pre-notification for an upcoming outage.

1           Loss of External Supply

2           Loss of external supply outages are outages that are caused by a loss of source power  
3           from a non-Eversource entity. i.e., Green Mountain Power

4           Public Safety directed outages

5           Public Safety directed outages are outages directed by ISO, municipal, police, or  
6           fire authority, to remove electric service for public safety concerns which have no  
7           reasonable expectation for when power may be restored. i.e., flooded areas, load  
8           shed etc.

9           Major Event Days (TMED)

10          Major event days for the reporting year are days in which the daily system SAIDI  
11          exceeds a threshold value, the TMED, as defined in IEEE 1366-2012. The threshold  
12          is calculated annually at the end of the reporting period for the subsequent reporting  
13          period.

14   **Q.    How is the Company proposing to develop the baseline and target for these metrics?**

15    A.    The Company is proposing to use a five-year rolling average with 2 standard deviations as  
16          upper and lower bounds as the baseline for both Service Quality metrics, measuring SAIDI  
17          and MBI. This measure keeps the NH performance in these two areas within the upper and  
18          lower bounds for all years from 2016 to the present day. The five-year measure also takes

1 into account the present day reliability reality where the NH reliability measures since 2019  
2 have been within first and second quartile to the present day.

3 The targets would be calculated yearly, using the upper and lower bounds. Please see the  
4 tables below outlining this calculation.

5 Table 1: SAIDI Target Calculation

	Historical SAIDI	Five year rolling average	Five year rolling 2 standard deviations	Max target	Min target
2012	141.3				
2013	136.0				
2014	120.0				
2015	102.8				
2016	132.1	126.4	30.7	95.7	157.2
2017	108.5	119.9	28.8	91.1	148.7
2018	107.5	114.2	23.7	90.5	137.9
2019	68.9	104.0	45.3	58.6	149.3
2020	85.5	100.5	48.3	52.2	148.8
2021	83.8	90.8	33.9	56.9	124.7
2022	71.9	83.5	30.5	53.1	114.0
2023	74.4	76.9	14.7	62.2	91.6

6

1

Table 2: MBI Target Calculation

	Historical MBI	Five year rolling average	Five year rolling 2 standard deviations	Min target	Max target
2012	10.4				
2013	10.8				
2014	9.8				
2015	11.8				
2016	9.1	10.4	2.0	8.3	12.4
2017	12.5	10.8	2.8	8.0	13.6
2018	13.3	11.3	3.6	7.7	14.9
2019	21.5	13.6	9.3	4.3	23.0
2020	17.5	14.8	9.6	5.2	24.4
2021	17.9	16.5	7.4	9.2	23.9
2022	20.7	18.2	6.5	11.7	24.6
2023	20.8	19.7	3.7	16.0	23.4

**Q. Is the Company proposing to attach a penalty to the Service Quality metrics?**

A. Yes. The Company is proposing to establish a penalty to the Service Quality metrics to set its commitment to the proposed PBR Plan and accompanying PBR metrics during the 4-year term. For each Service Quality metric, the Company proposes to apply a penalty equal to the Company’s proposed exogenous cost threshold of \$1.5 million. If the Company does not meet the target annually during the 4-year PBR Plan term, the Company would be assessed a penalty of \$1.5 million for each year it does not meet the target. For any year the Company exceeds the target, the Company will receive a credit of \$1.5 million that may be applied as an offset to any future penalty under this metric.

1        **B.     Reporting Metrics**

2                    1.     Customer Satisfaction

3        **Q.     What are the two Customer Satisfaction metrics the Company is proposing?**

4        A.     The two Customer Satisfaction metrics include Number of Customer Complaints Reversed  
5                    and the Transactional Customer Satisfaction Index.

6        **Q.     Please describe the Number of Customer Complaints Reversed metric.**

7        A.     The Company is proposing a reporting metric on the number of customer complaints  
8                    received by the New Hampshire Department of Energy (“NHDOE”) and more specifically,  
9                    those that were “reversed” customer complaints, which are complaints where an error by  
10                   the Company is validated and acknowledged after investigation. Focusing on reversed  
11                   customer complaints is supported within the Company’s position within the PBR  
12                   framework of accountability for items mostly or completely within the Company’s control.

13       **Q.     How is the Company proposing to measure this metric?**

14       A.     To standardize a measure of customer complaints relative to the size of the Company’s  
15                   New Hampshire customer base, this metric would be reported as the number of reversed  
16                   customer complaints to the NHDOE per 10,000 customers. This can be represented by the  
17                   following formula:

18

$$\begin{array}{l} \text{[Number of reversed} \\ \text{customer complaints} \\ \text{per 10,000]} \end{array} = \frac{\begin{array}{l} \text{[Number of reversed} \\ \text{customer complaints]} \end{array}}{\begin{array}{l} \text{[Total Number of} \\ \text{Customers]} \end{array}} \times 10,000$$

19  
20

1 As an illustrative example, in a given year assuming 87 reversed complaints and 538,000  
2 NH customers, the final reported score would be 1.62.

3 **Q. What is the Company’s proposed baseline and target for this metric?**

4 A. The Company is proposing to develop the baseline for this metric using the average rate  
5 of reversed complaints received by NHDOE during calendar years 2022-2024. The target  
6 will then be for the Company to remain at or better than the baseline yearly during the PBR  
7 term. Once the Company has collected all the data for calendar years 2022-2024, the  
8 Company proposes to supplement this metric with the calculated baseline and target values  
9 on March 1, 2025 before the end of this proceeding.

10 **Q. Please describe the Transactional Customer Satisfaction Index metric.**

11 A. The Company is proposing a reporting metric called the “Transactional Customer  
12 Satisfaction Index.” This index is intended to capture major customer transactional  
13 touchpoints with the Company. Individual components of this metric include (1) customer  
14 satisfaction after being restored from a blue-sky outage; (2) satisfaction after interacting  
15 with the Company’s phone customer service resources, either live-agent or interactive  
16 voice; (3) satisfaction with the process of interconnecting solar resource at a customer’s  
17 home; (4) satisfaction with working to connect new construction to the grid; and  
18 (5) satisfaction after using the Company’s website.

1 **Q. How is the Company capturing the components of this metric?**

2 A. The Company has several surveys that it is utilizing to capture the components outlined  
3 above. These include the following surveys:

- 4 • Unplanned Outage Restoration Survey
- 5 • Post-Contact Customer Satisfaction Survey
- 6 • Solar Producer Survey
- 7 • New Customer Connect Electric Survey
- 8 • Web Satisfaction Survey

9 The Unplanned Outage Restoration Survey, the Post-Contact Restoration Survey, and  
10 Solar Producer Survey, are transactional surveys conducted via the Qualtrics online  
11 research platform, with customers being invited to provide feedback in an email invitation.  
12 For each survey, invitations are sent to a random selection of eligible customers on a daily  
13 basis. The Web Satisfaction Survey is an in-channel survey, where a random selection of  
14 visitors to the website are invited to participate in a follow-up survey following the  
15 completion of their transaction. The New Customer Connect Electric Survey is conducted  
16 among electricians and contractors who work with Eversource on new service requests and  
17 is conducted by a third-party vendor via telephone. The vendor is provided a list of eligible  
18 completed jobs on a weekly basis and continuously works through the list to complete as  
19 many survey interviews as possible.

20 **Q. Please describe how the Company proposes to measure this metric.**

21 A. The Transactional Customer Satisfaction Index will comprise an average of the individual  
22 components outlined above, giving each component equal weighting. The actual mean  
23 score for each of the satisfaction components is based on the customers' rating using a scale

1 of 1, unacceptable, to 10, outstanding. The goal of giving each component equal weighting  
2 as opposed to a weighted average based on survey responses, is to avoid “drowning out”  
3 individual components with lower volume of surveys, such as the satisfaction with the solar  
4 interconnection process or satisfaction with the new service request process. Such  
5 components will never have the same volume of responses to compete with, for example,  
6 the outage restoration satisfaction component, but is still a vital touchpoint for a growing  
7 segment of New Hampshire customers.

8 **Q. How will this metric be calculated?**

9 A. The Transactional Customer Satisfaction Index will be calculated by weighting the average  
10 score of each component metric by 20 percent, and then summing the resulting output  
11 together to calculate a combined index score.

12 **Q. What is the Company’s proposed baseline and target for this metric?**

13 A. Similar to the Number of Customer Complaints Reversed metric, the Company is  
14 proposing to develop the baseline using the average result for each metric component in  
15 2022-2024, weighing each score by 20 percent. An average margin of error of each  
16 individual component will also be incorporated into the baseline. The target will then be  
17 for the Company to remain at or better than the baseline yearly during the PBR term. Once  
18 the Company has collected all the data for calendar years 2022-2024, the Company  
19 proposes to supplement this metric with the calculated baseline and target values on March  
20 1, 2025 before the end of this proceeding.

1 **Q. Why is the Company proposing to report on customer satisfaction through these**  
2 **surveys in this metric instead of providing the traditional overall customers**  
3 **satisfaction rating?**

4 A. The Company maintains that the use of a reporting metric such as the Transactional  
5 Customer Satisfaction Index is a more balanced metric than utilizing a traditional overall  
6 customer satisfaction rating. The Company's long-standing Voice of the Customer Team  
7 has ample research showing how heavily influenced an overall customer satisfaction rating  
8 can be on the perception of many factors mostly or completely outside of the Company's  
9 control, particularly in the area of cost.

10 2. Solar Generator

11 **Q. Please explain the importance of Solar Generator PBR metrics alongside the**  
12 **Company's proposed PBR Plan.**

13 A. Eversource is determined to streamline, measure, and constantly seek opportunities for  
14 improvement in distributed energy resources ("DER") customer satisfaction.. These goals  
15 align with those of the PBR Plan in facilitating clean energy interconnection and enhancing  
16 customer satisfaction with DER integration.

17 **Q. Please describe the complexity of the customer process in integrating DER.**

18 A. Ultimately, DER customer satisfaction is a complex shared responsibility by multiple  
19 stakeholders who have control or influence over certain parts of sequential and parallel  
20 processes, but not the entire process, in support of the overall DER customer journey.

21 This journey moves from a private purchasing decision between the customer and the DER  
22 Developer into a structured and regulated process governing interconnection standards and

1 customer compensation. Stakeholders in that process include policy makers themselves  
2 where simple, clear, easy to understand policy provides a faster, easier and less expensive  
3 landscape to navigate in all stages of this journey. Other stakeholders that drive the  
4 customer journey are applicants, installers, municipal inspectors and various departments  
5 within the Company such as Customer Care, Engineering, Metering, and Billing. The more  
6 complex a proposed project, the more departments, depth of analysis, and timing is  
7 required to ensure a safe and reliable interconnection.

8 **Q. What is the current state of New Hampshire DER interconnection programs and**  
9 **processes?**

10 A. Currently, the New Hampshire DER simplified projects are progressing smoothly and  
11 efficiently through the interconnection process and meeting customer/developer  
12 expectations. The more complex projects, those requiring engineering assessment and a  
13 System Impact Study (“SIS”), progress well, but due to the size and resultant impact on  
14 the electric system, require more time to complete. Eversource, and various stakeholders,  
15 are reviewing time frames for these complex interconnections in an effort to streamline the  
16 review process while ensuring a safe and reliable interconnect for both the interconnecting  
17 customer and the reliability of existing customers. There are currently active regulatory  
18 dockets reviewing current processes and timelines to complete the SIS applications, and  
19 the outcome of these dockets may in turn impact the baseline and calculation of this PBR  
20 metric. A consistent, stable process is a prerequisite to developing baseline statistics to  
21 show process improvement. If a process and timeline for SIS type interconnects is agreed

1 upon through the existing dockets, the Company would revise the PBR baseline as  
2 necessary for this metric through its proposed PBR annual reports.

3 **Q. Please describe the Company’s proposed process for tracking the interconnection of**  
4 **DER customers for the purposes of the Solar Generator metric.**

5 A. The Company recently invested in the tools to allow better customer self-service and  
6 tracking of the key performance indicators for the current process, given recent surges in  
7 DER applications over the past 3 years. The Company proposes to collect data on the  
8 timeline for solar applications for the purpose of establishing a baseline and a target by  
9 2027 for each of the following categories:

- 10 1. Simplified Projects – inverter based projects 100 kW and less.
- 11 2. Standard Projects – all non-inverter based projects, and inverter based projects  
12 greater than 100 kW that do not require a SIS.
- 13 3. Standard Projects requiring a SIS – projects greater than 100 kW, that require a  
14 SIS. Any project requiring an ISO Study is excluded from the timeline as these  
15 projects are to be grouped into ISO studies per FERC 2023.

16 **Q. How is the Company proposing to measure these performance indicators for the Solar**  
17 **Generator PBR metric?**

18 A. The Solar Generator PBR metric will be the percentage of applications meeting the  
19 performance targets. This will be calculated by dividing the number of solar applications  
20 meeting performance targets by the total number of solar applications. The Company  
21 proposes to report on this metric on the three categories identified above: (1) simple  
22 (<100kW) applications, (2) standard (>100kW) applications not requiring a system impact  
23 study (“SIS”), and (3) standard (>100kW requiring a SIS, not requiring an ISO study) .

1 **Q. How will the baseline and target be developed for this metric?**

2 A. The Company proposes to collect three years of data during calendar years 2024 through  
3 2026 for purposes of establishing the baseline for solar applications for all three types of  
4 applications outlined above. The Company would then propose a baseline and a target in  
5 its PBR metrics report filed during calendar year 2027 with a description of how the  
6 baseline and target is calculated. Prior to this report, the Company will commit to reporting  
7 on the annual timelines in the PBR metrics reports filed during calendar years 2025 and  
8 2026.

9 3. Operations – Customer Work Request

10 **Q. Please describe the Company’s proposed Customer Work Request metric within this**  
11 **performance area.**

12 A. The Customer Work Request metric will measure the percentage of work requests the  
13 Company completes within a target number of business days in four types of service  
14 categories. The time will be calculated from the creation of a work request to the  
15 completion of work or the meter in-service date, in number of business days, excluding  
16 hold days.

1 The four types of service categories and the business day targets for each are as follows:

Type of Service	Definition of Type of Service	Business Day Targets
Simple Service	A single span of single-phase secondary to meter location Time frame starts when all Customer Obligations including wiring inspection are complete.	≤8 days
Customer Requested	Customer requested work: includes cover for wires, meter floats and service disconnect/reconnects	≤11 days
Developments (Residential/ Commercial)	Developments for main electric infrastructure, not individual services	≤90 days
Complex Services	Any service requiring design	≤43 days

2

3 This metric will provide insight into how well the Company is facilitating customer  
4 requested work in a timely manner.

5 **Q. How did the Company calculate the business day targets in which the work request**  
6 **should be completed?**

7 A. The Company calculated the business day targets for this PBR metric proposal based on  
8 the average number of business days, excluding hold days, that it took for the Company to  
9 complete the customer work requests in each category in New Hampshire in calendar year  
10 2023.

11 **Q. Would you please provide some examples of “hold days” that are excluded from the**  
12 **business days reported for this metric?**

13 A. These include the following delays which are not within the Company’s control:

- 1           • Time waiting for customer obligations such as payment, easements, etc.
- 2           • Time waiting for all the necessary customer load information, approved drawings
- 3           and site plans, and any other customer information required to complete the design;
- 4           • Time for municipality or State to issue a permit for Company infrastructure on
- 5           public way (e.g., Poles);
- 6           • Traffic control cancellations;
- 7           • Time waiting for the customer to complete their scope of work;
- 8           • Customer municipal inspection approval; and
- 9           • Force majeure or Emergency Response Plan.

10           The Company excludes any days that fall within the categories above from the metric  
11           calculation, as these are instances where the Company cannot control how quickly the  
12           issues are remedied. This metric proposes to measure the Company's performance  
13           completing work requests in instances where the variables and delays are within the  
14           Company's control.

15   **Q.    Are there any examples of “hold days” or times where a delay is outside of the**  
16   **Company’s control that have been included in the baseline data?**

17   **A.**    Yes. In some cases, the customer will request an appointment date that is further out than  
18           the business day target on their own accord, which can be due to various reasons on behalf  
19           of the customer. This delay, past the business day target, is agreed upon by the Company  
20           and the customer in advance and the Company will complete the work on the appointment  
21           date, as requested and agreed upon. Even though this work was done outside of the  
22           business day target, the Company still performed the customer requested work in a timely  
23           manner based on the customer's request.

1 Because these instances have not altered the data significantly, the Company has kept these  
2 types of “hold days” in the calculation of the baseline and will continue to include it to  
3 calculate the metric for future PBR metrics reports to maintain consistency. However, if  
4 there are several instances of this in a future PBR term year which alters the data  
5 significantly, the Company will explain this in its PBR metrics report and it should not  
6 negatively affect the Company’s overall performance in this metric category.

7 **Q. Please describe how the Company proposes to calculate the percentage of customer**  
8 **requested work that meets the business day targets.**

9 A. The percentage of customer requests meeting the business day targets would be calculated  
10 by adding the number of requests that are completed within or under the target number of  
11 business days for each category and dividing that number by the total number of work  
12 requests across all four categories. This will provide a better overall measure of  
13 performance because it will weigh each category equally.

14 The Company proposes to give each category equal weighting in this manner and report  
15 out on the combined average because of the inherent differences in volume and complexity  
16 for each of the categories. For example, there is a much higher volume of simple service  
17 requests than development requests. However, the Company needs to give equal attention  
18 to both types of requests. Therefore, a combined average will show consistent timely  
19 performance in completing customer work across all four categories of work requests.

1 **Q. Has the Company determined a baseline and a target for the Customer Work Request**  
2 **metric?**

3 A. The Company has collected data for all four categories for calendar year 2023 and  
4 calculated a baseline of 90 percent using the above calculation. The target for this metric  
5 is for the Company to remain at or better than the baseline of 90 percent annually for the  
6 4-year PBR term, 2026-2029.

7 However, because the Company calculated this metric baseline using only one year of data  
8 (2023), there is a reasonable range of uncertainty included with this metric. Therefore, the  
9 Company proposes to be able to explain and alter this baseline in its annual PBR metrics  
10 report in 2026 if calendar year 2023 becomes anomalous as compared to subsequent years.  
11 At that time, the Company would propose to utilize a three-year average (2023-2025) to  
12 calculate the baseline, similar to the other metrics proposed.

13 4. Active Demand Response

14 **Q. Please describe the Company's Active Demand Response metric.**

15 A. For the Active Demand Response metric, the Company proposes to measure the active  
16 demand reduction as the sum of the "Net Summer kW" reductions from the measure-level  
17 calculations tab in the Eversource Electric Active Demand Response ("ADR") Models.  
18 These ADR Models are filed in the Plan-Year Reports for the 2024-2026 Three-Year  
19 Energy Efficiency Plan Term. All active demand reductions in a given year are reported  
20 for that year and are only attributable to that year.

1 **Q. What is the baseline and target for this metric?**

2 A. The baseline will be 7.5 MW, which is the average demand reduction per the 2021-2023  
3 Q4 Reports. The Company proposes to remain at or better than 14.5 MW annually for the  
4 4-year PBR Term, which is the average MW reduction per the 2024-2026 EE Plan.

5 **Q. What is the value created by active demand response through the PBR Plan?**

6 A. Peak demand is a major driver of costs experienced by the Company's customers.  
7 Proactive efforts to reduce peak demand can generate significant reductions in system costs  
8 for customers as the electric system as a whole must be sized to meet peak demand (at the  
9 system and local levels). The Company's Active Demand Response metric will focus on  
10 PSNH's system peak, which occurs during the summer months.

11 Key benefits to customers from reducing system peak demand include avoided capacity  
12 market and energy costs and efforts on peak demand management can drive expanded or  
13 innovative Company efforts to provide these benefits to customers.

14 **IV. CONCLUSION**

15 **Q. Does this conclude your testimony?**

16 A. Yes, it does.
