(Existing joint owned utility pole (PSNH/Fairpoint) in existing Right-of-Way)

E-30/47 - T-17/47
(Existing joint owned utility pole (PSNH/Fairpoint) in existing Right-of-Way)

E-30/48 - T-17/48

Construction Notes:

NHOS proposes to install a 1/4 inch metal supporting strand between the existing utility poles shown above that will traverse the river. The strand will be installed at the proposed height (see above). The supporting strand will be secured to each pole using double dead end attachments to prevent any sag in the wire and maintain proper clearances. NHOS will lash a one inch diameter fiber optic cable (PVC jacket) to the strand using a dual lash method to provide security of the fiber over the right of way. The fiber will be tagged with twenty four hour contact information at each pole clamp. NHOS will employ the proper safety personnel during the crossing installation. The proposed install will meet all proper clearances from other Utilities. (see above). Additional pole guys will be added per NESC Rule 264 and as directed by pole owners.

Proposed River Crossing Gorham, NH

Notes:

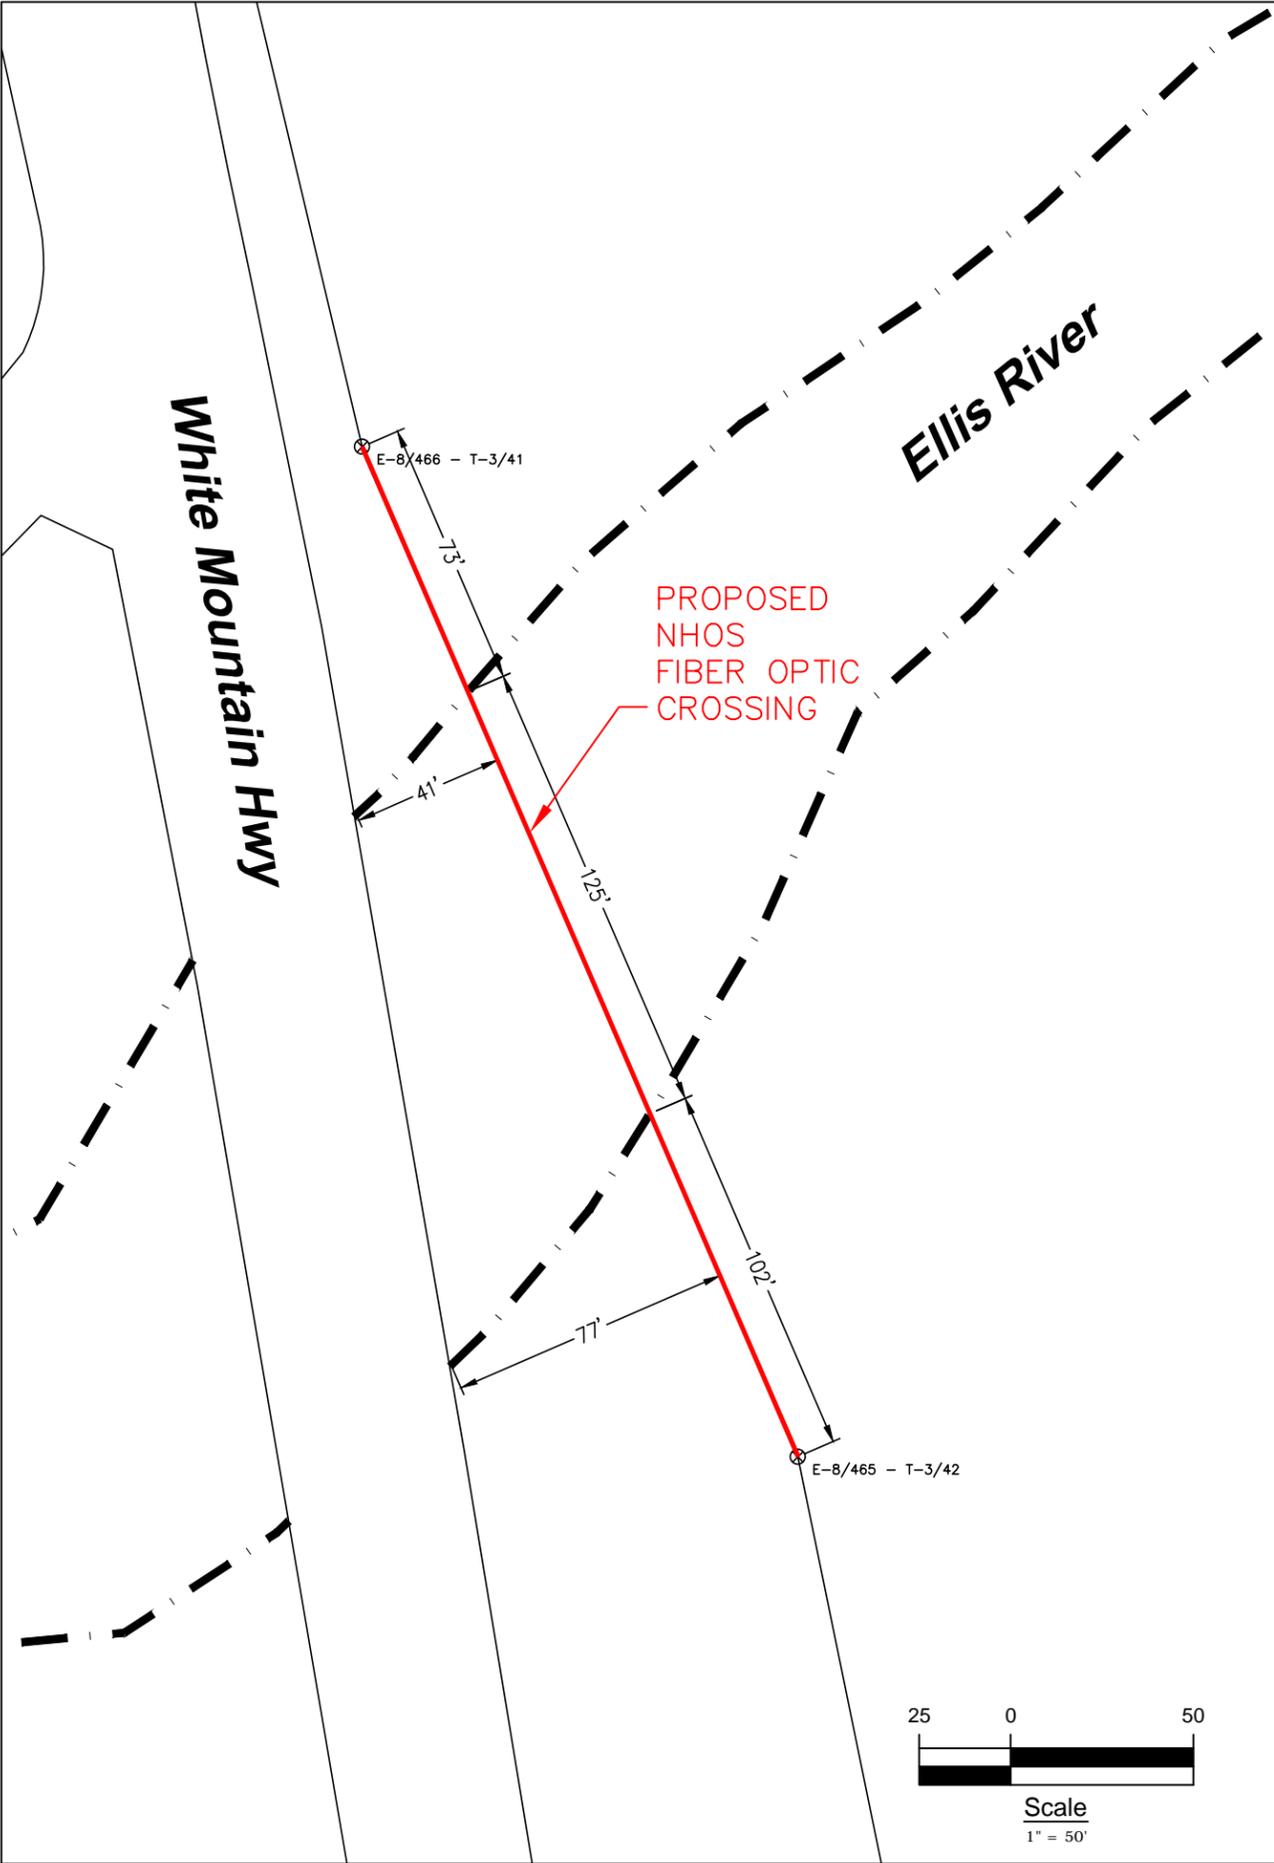

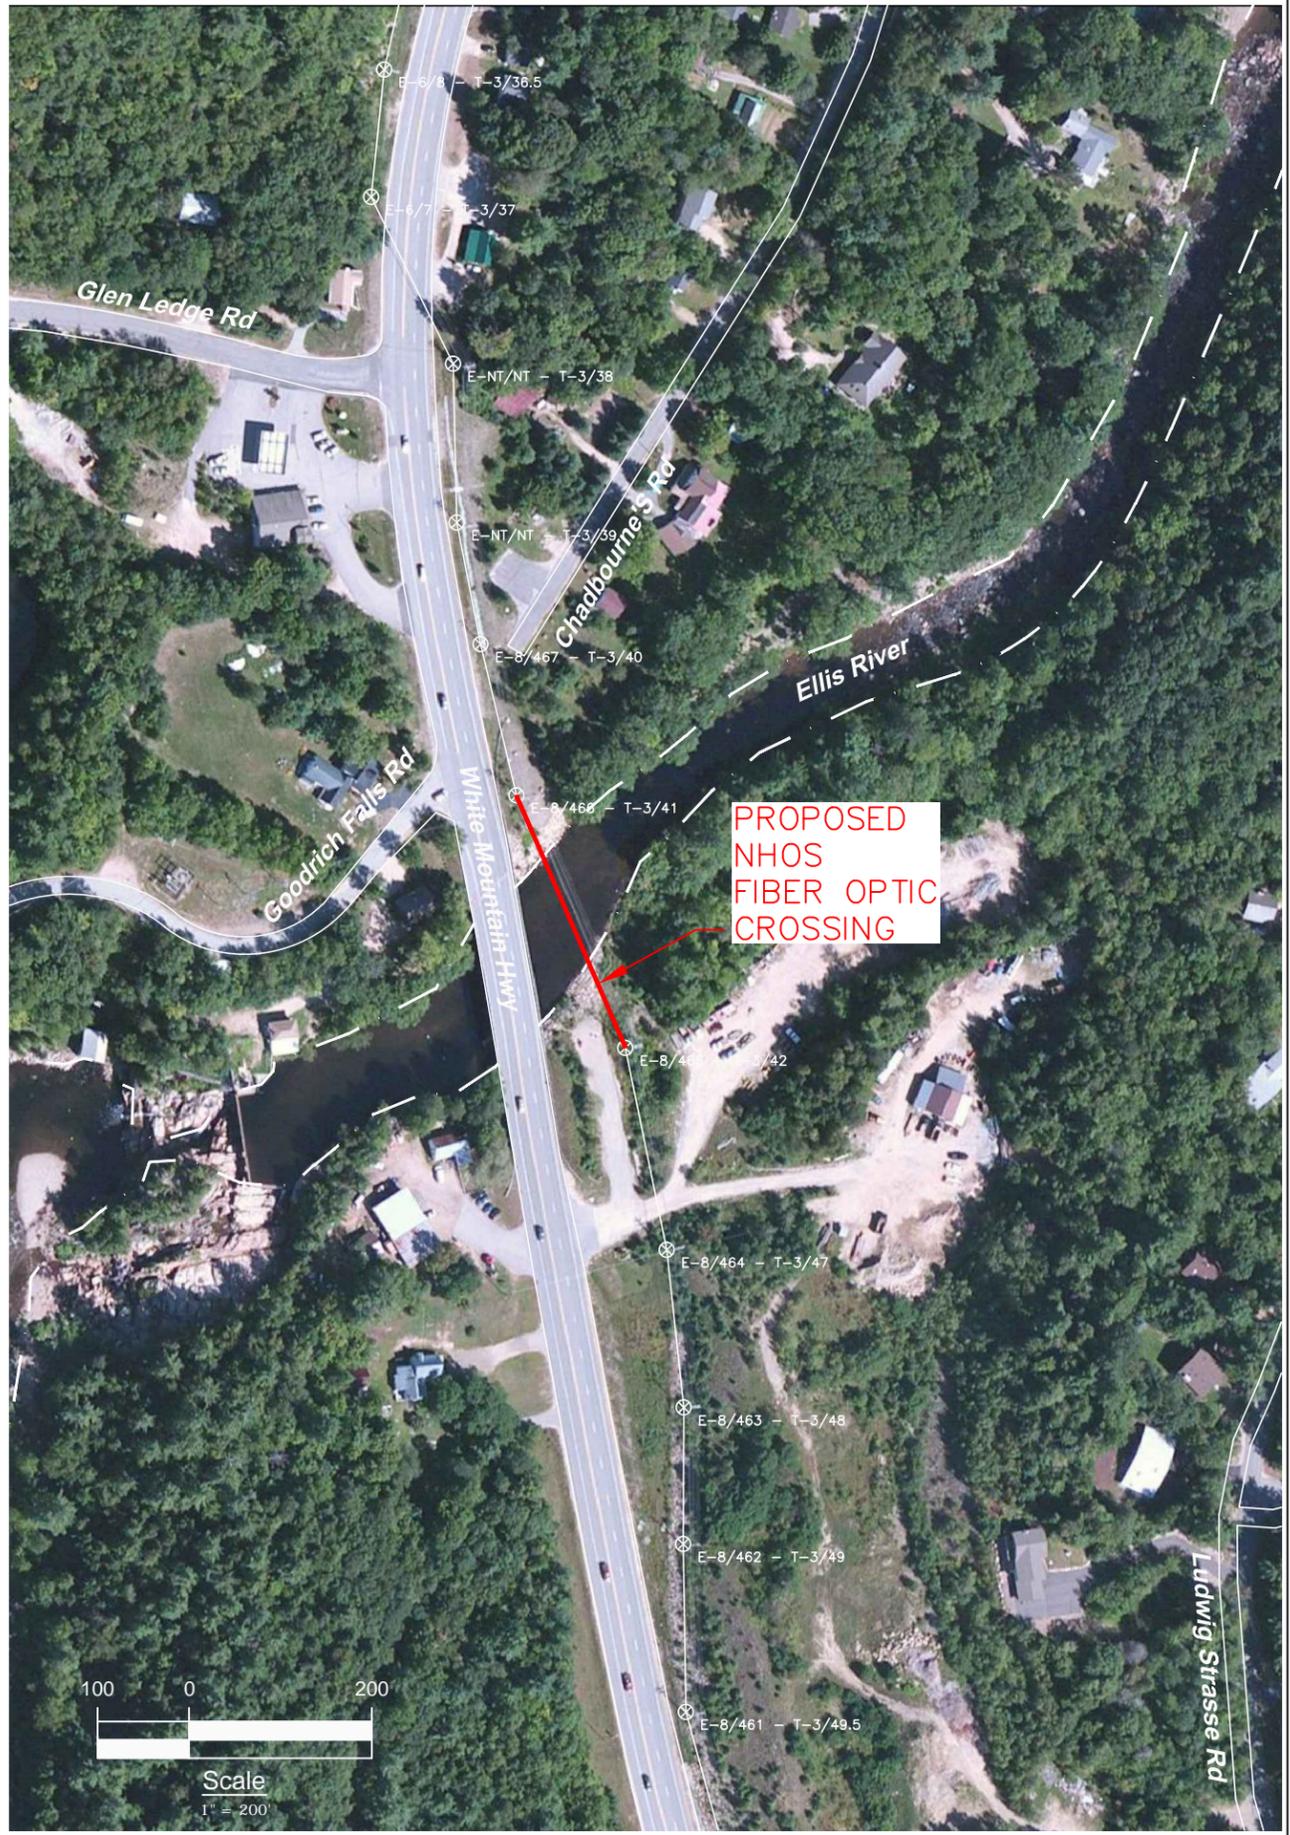

- The heights of structures shown hereon are based on field measurements taken with a Nikon 362 total station during a site survey on 11/08/11.
- The horizontal distance between the nearest bridge edge and the existing overhead wires ranges from 24' to 25'.
- The smallest vertical distance from the top of existing bridge deck to the lowest existing overhead wires is 12'.
- The vertical distance between the top of water and bridge deck is approximately 23'.
- The waterway is classified as not suitable for sail boating and per NESC Table 232-1 a vertical clearance of 14' must be maintained between the lowest conductor and 10 year floodplain.
- Based on the FEMA Flood Profile for the Peabody River (Page 122P) and the Flood Insurance Rate Map for the Town of Gorham, Coos County, (Community Panel Number 330032 0015 C) dated May 2, 1994 the difference between the river bed and the 10% Chance Flood Event is 8'.
- Vertical distances are representative of attachment heights after utility make ready moves are completed.

Proposed River Crossing Bartlett, NH

Notes:

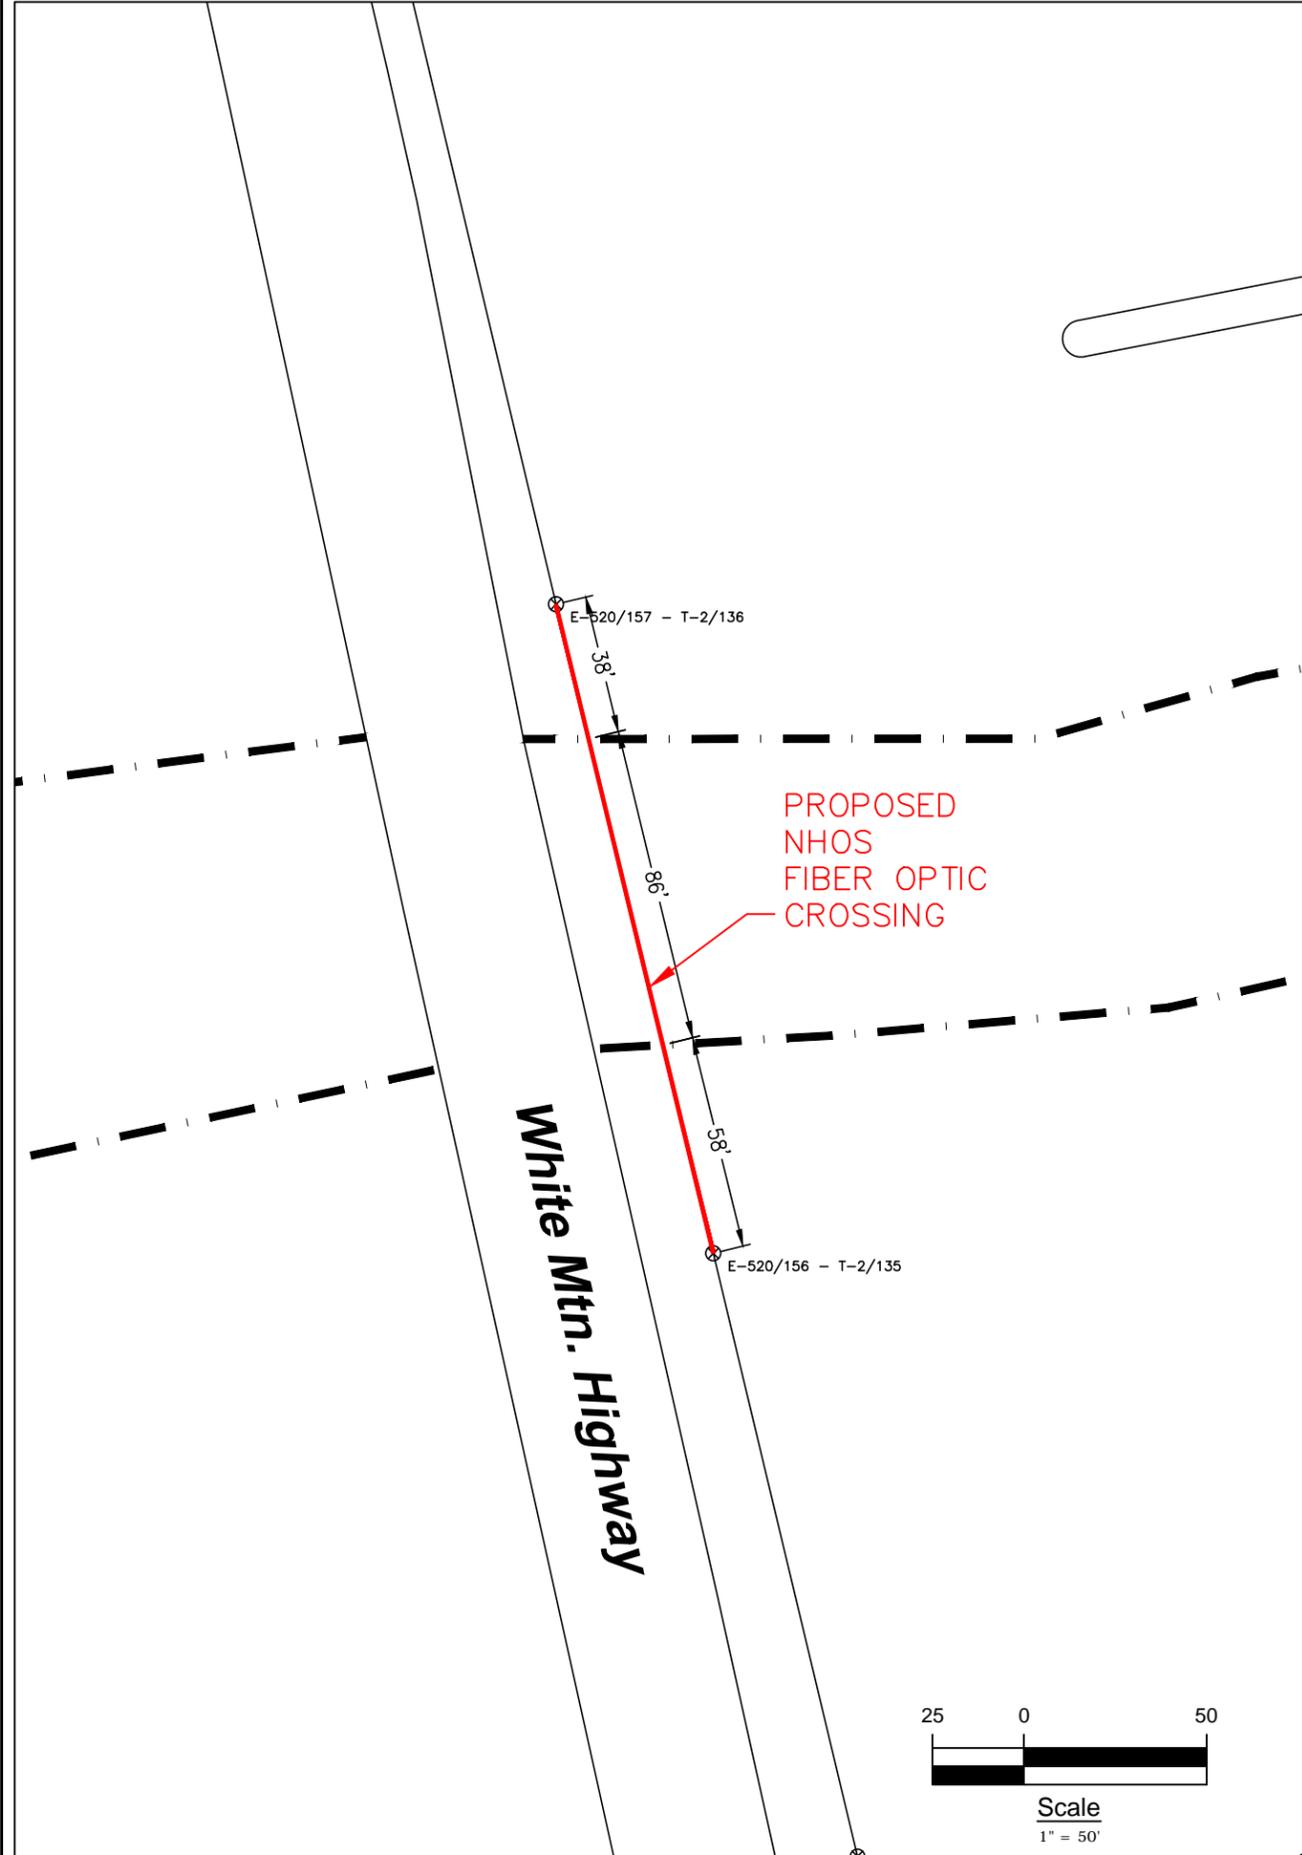

- The heights of structures shown hereon are based on field measurements taken with a Nikon 362 total station during a site survey on 11/08/11.
- The horizontal distance between the nearest bridge edge and the existing overhead wires ranges from 41' to 77'.
- The smallest vertical distance from the top of existing bridge deck to the lowest existing overhead wires is 12'.
- The vertical distance between the top of water and bridge deck is approximately 28'.
- The waterway is classified as not suitable for sail boating and per NESC Table 232-1 a vertical clearance of 14' must be maintained between the lowest conductor and 10 year floodplain.
- Based on the FEMA Flood Insurance Rate Map for the Town of Bartlett, Carroll County, (Community Panel Number 330010 0010 C) dated March 1, 1984 there is no 10% chance flood event information available for this area.
- Assuming the existing bridge deck was built above the 10% flood event we can safely assume that the lowest existing overhead wire is at least 12' above the 10 year flood plain.
- Vertical distances are representative of attachment heights after utility make ready moves are completed.

**Proposed Crossing
Saco River
Conway, NH**

Notes:

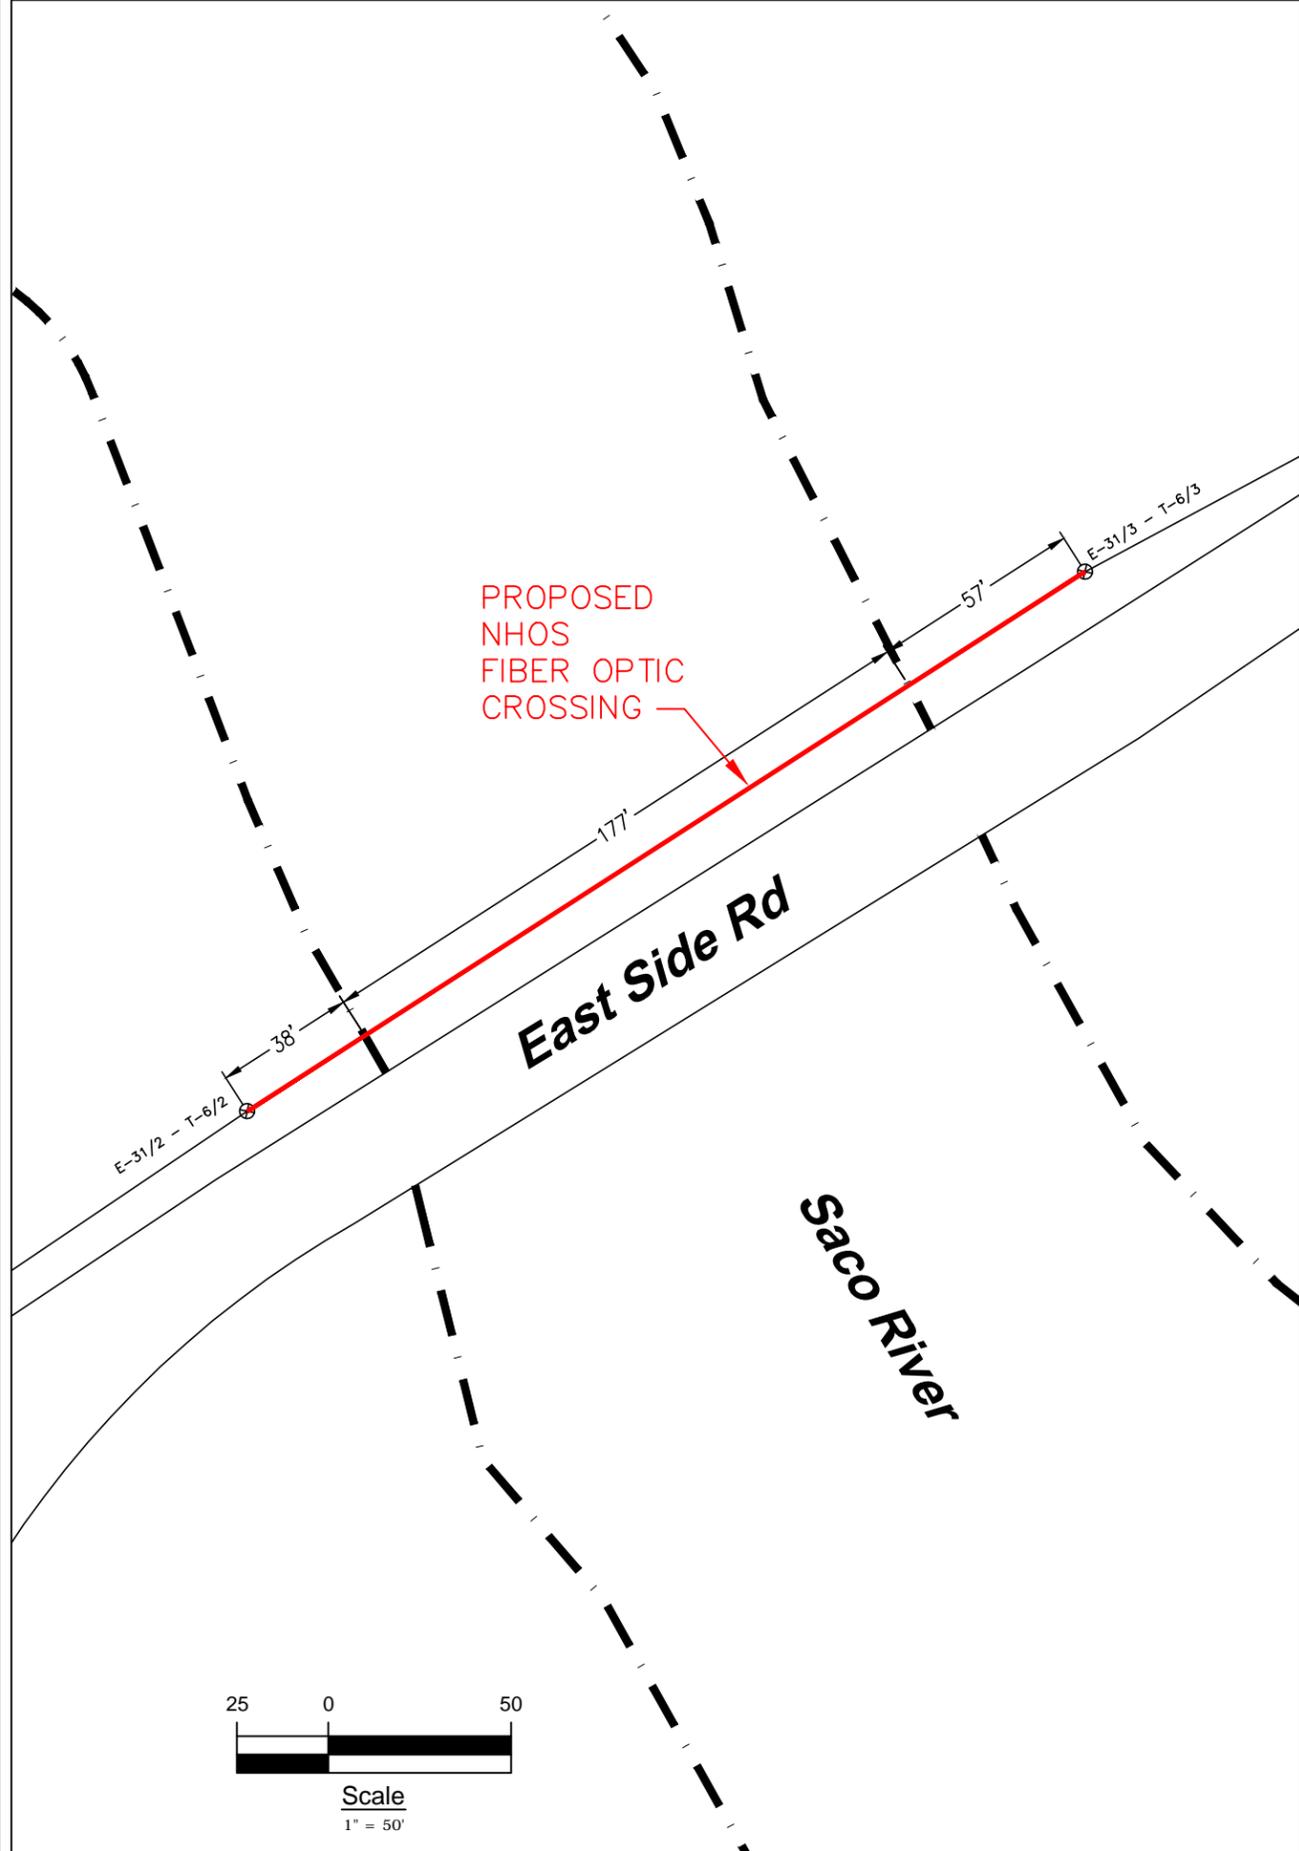

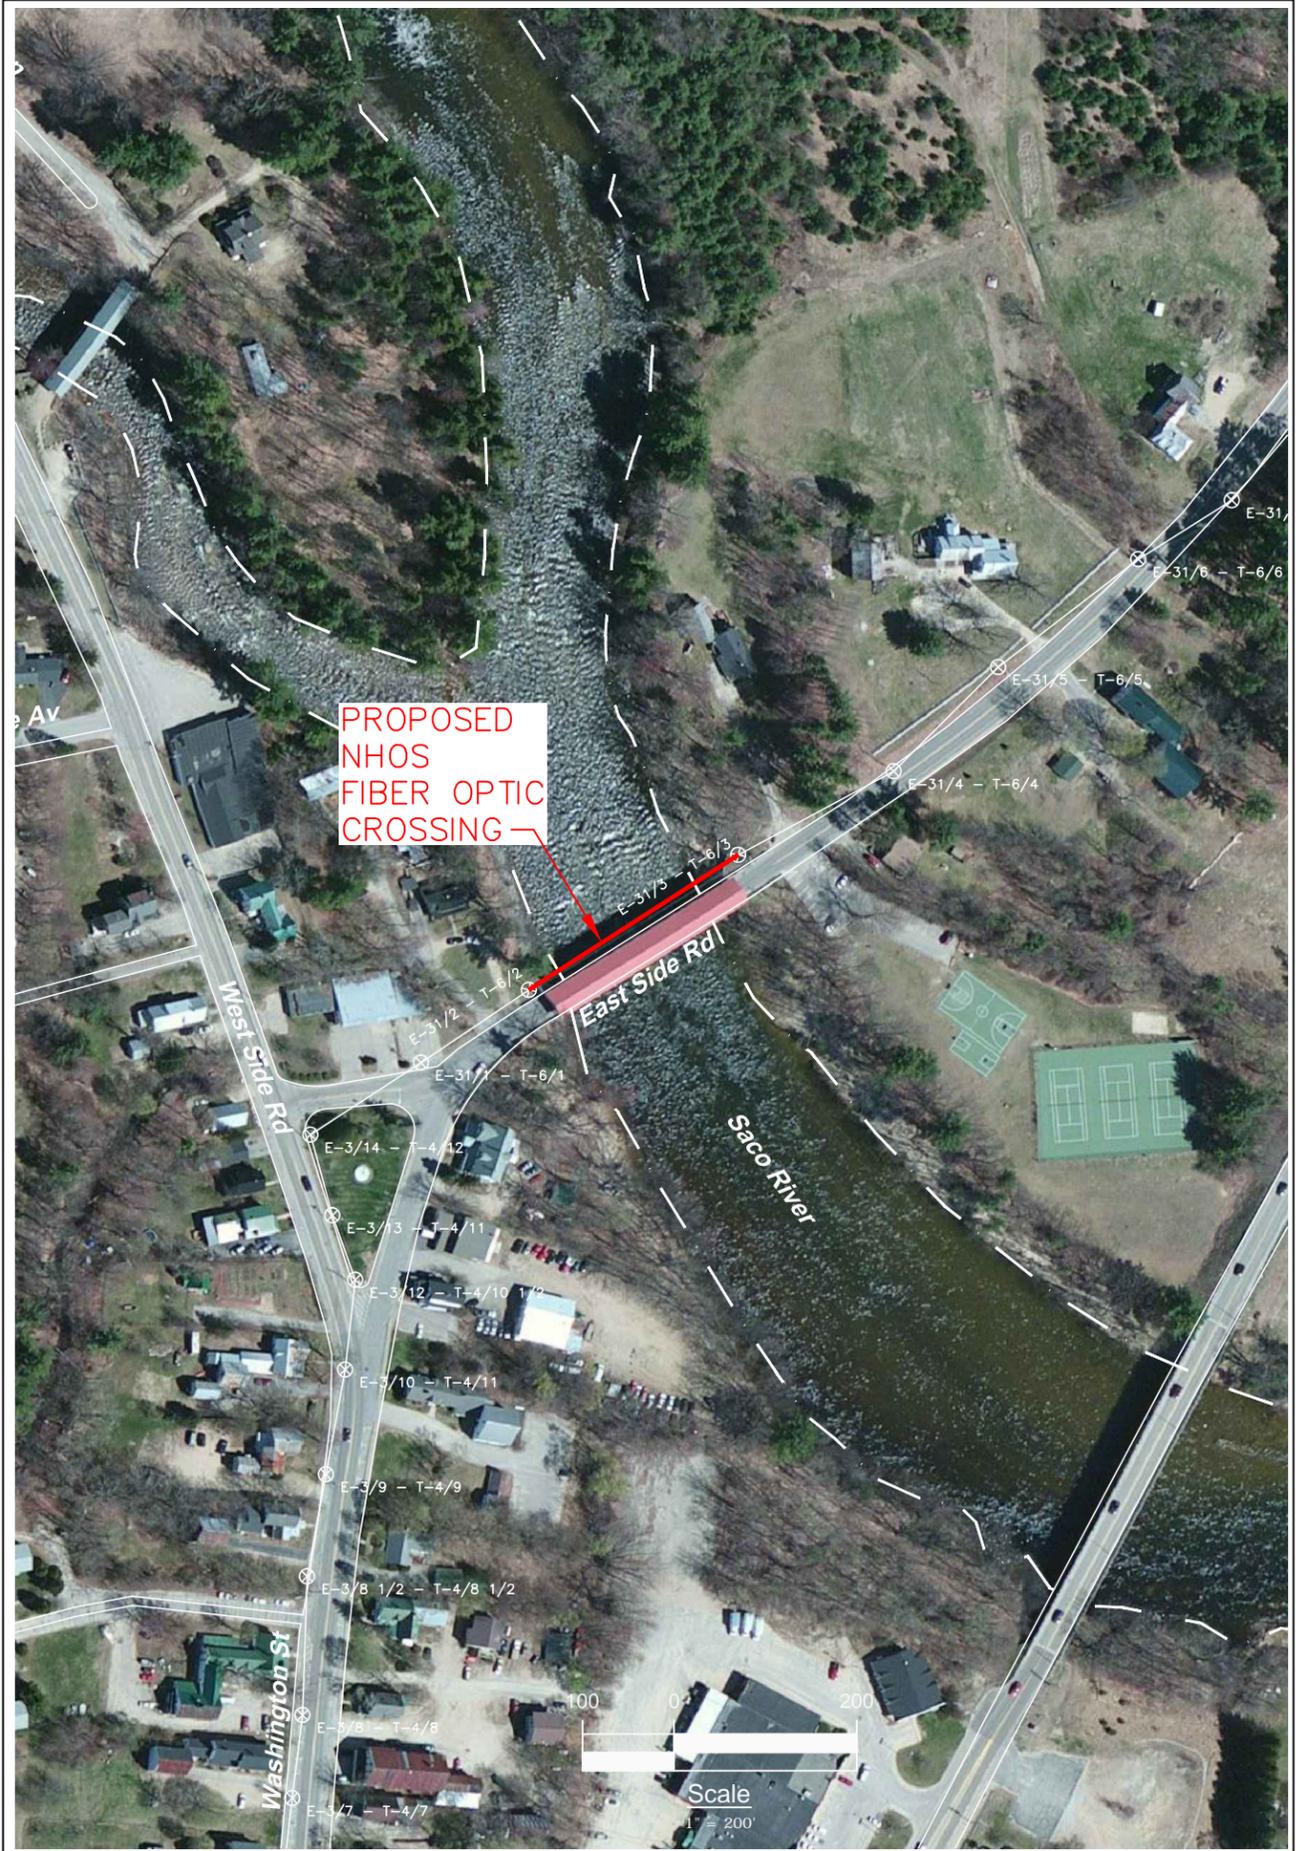

- The heights of structures shown hereon are based on field measurements taken with a Nikon 362 total station during a site survey on 11/9/11.
- The waterway is classified as not suitable for sail boating and per NESC Table 232-1 a vertical clearance of 14' must be maintained between the lowest conductor and 10 year floodplain.
- Based on the FEMA Flood Profile for the Saco River (Page 59P) and the Flood Insurance Rate Map for Carroll County (County Map Number 3300110040C) dated 6/3/02 a conservative 10 year flood elevation was calculated by adding the delta between the river bed and the 10 year flood elevation to the surveyed water level and then the 14' buffer (for non-navigable streams) was added to that.
- Vertical distances are representative of attachment heights after utility make ready moves are completed.

Unloaded Strand
Sag = 1.26 ft (15.2 in) 0.46 %
Tension = 886 lb

E-31/2 - T-6/2
(Existing joint owned utility pole (Fairpoint/PSNH) in existing Right-of-Way)

E-31/3 - T-6/3
(Existing joint owned utility pole (Fairpoint/PSNH) in existing Right-of-Way)

E-31/2 - T-6/2

Construction Notes:

NHOS proposes to install a 1/4 inch metal supporting strand between the existing utility poles shown above that will traverse the stream. The strand will be installed at the proposed height (see above). The supporting strand will be secured to each pole using double dead end attachments to prevent any sag in the wire and maintain proper clearances. NHOS will lash a one inch diameter fiber optic cable (PVC jacket) to the strand using a dual lash method to provide security of the fiber over the right of way. The fiber will be tagged with twenty four hour contact information at each pole clamp. NHOS will employ the proper safety personnel during the crossing installation. The proposed install will meet all proper clearances from other Utilities. (see above). Additional pole guys will be added per NESC Rule 264 and as directed by pole owners.

Conway, NH**

Notes:

- The heights of structures shown hereon are based on field measurements taken with a Nikon 362 total station during a site survey on 11/15/11.
- The horizontal distance between the nearest bridge edge and the existing overhead wires ranges from 12' to 13'.
- The smallest vertical distance from the top of existing bridge deck to the lowest existing overhead wires is 16'.
- The vertical distance between the top of water and bridge deck is approximately 24'.
- The waterway is classified as not suitable for sail boating and per NESC Table 232-1 a vertical clearance of 14' must be maintained between the lowest conductor and 10 year floodplain.
- Based on the FEMA Flood Profile for the Saco River (Page 60P) the difference between the stream bottom and the 10% flood elevation is 15'. This 15' was added to the existing stream bed and then the 14' buffer (for non-navigable streams) was added to that.
- Vertical distances are representative of attachment heights after utility make ready moves are completed.
